I know yall have been waiting and finally got some pics. But I am going to try to auction this item myself not using one of the internet auctions. I am a complete novice a pc and I don't have time how to figure out how to get my pics on there or all the other bs they wanted .So here's what im gonna do. The auction will start immediately when this post. The minimum bid will be 25$ the winner will pay with a money order or cert check. He or she will also pay half the shipping from 77520. The auction will end sunday july 2 2000 at 7:oo pm central. To show proof of who is the high bid or who was first I will forward e-mail upon request. To bid or find out more about the Demco please e-mail me at tgnagy1@earthlink.net

You're not really worth my time Jeff. I can't believe that you are now denying that you emailed my ISP with the particular passage that I quoted.

By the way, there is an Outlook Express 5 available, it has been for about a year now. Perhaps you would like to upgrade.

Also, since you refer to me as a cracker, I was wondering... am I salted or unsalted? What brand am I? Do you like to eat crackers? If so, what is your favorite brand? I like peanut butter and crackers, or those nice little Ritz crackers, they really rock.

Have a nice day

12. FS: new Cobra 148

Newsgroup: rec.radio.cb
Date: 2000-07-01 00:00:00 UTC
From: klajr2 <klajr2@swbell.net>
Message-ID: <395E283B.1906@swbell.net>
Source record: 41909

I have a Cobra 148 NW ST
This is the Night Watch with green illuminated face plate
It was taken out of the box only to have a peak and tune and super mod
by a very reputable cb shop in Ennis, TX (Bills cb shop) anyone in TX
knows this guy is high quality.
Radio is 4 watts dead key, 22 watt swing. Apperance: Flawless
Will ship in original box with manual and all mounting accessories.
Bought for my Dad as gift, he didnt want it (oh well).
Basically never used except for the tune up.
Asking $169.00(best internet price although I paid retail) plus $31.00
for the tune up. $ 200.00 plus shipping.
Fair enough?
Ken
Texas

>
>> That is certainly your opinion, however for the money I would choose
>>differently..... They are, and always have been, OVERPRICED!

For the most part, that's true, but really I wasn't suggesting that the 2000 is the only model worth having. I also use a later-model Washington and enjoy the hell out of that one too, and yes it's cheaper overall than finding a 2000. I was only speaking of that kind of set up, not strictly any one model of radio...
My main point was that ANY well-maintained and properly tuned/aligned/operated radio from earlier eras can be had for less money than newer models in general, and will almost always (in my opinion of course) sound better and work for you longer with less tinkering required, unlike most of the "export-only" mobile-as-base set-ups. You can have a 10kW amp and all the tricks but if conditions are not with you, you STILL won't get out... and if you have 5 watts and a coathanger antenna, and conditions are on your side, you can work the world... with that kind of playing field, you might as well go for the nicest audio (rx and tx) and ease of operation, and save the money.
Besides, I like the look of those odler rigs more than any Galaxy or Connex, etc. :-)
As always, just my opinion.
Linus

14. Who will be going to Hot Springs,Ark next weekend???

hey butt whipe, who called your name on the bowl, which unauthorized
non com poop did such a thing . and you think you are doing something.
well let me tell ya, if you can get your name called on the bowl with a
damn 8 pill, then i must be dreamin. from what i know, you are just a
pipsqueak and your stuff wouldn't even make a good driver, boy. so get

out of here with your bs. remember, when you get yourself a job and stop living off of the government, then and only then will you be able to buy what you need to do the job effectively. until then take a big number and stand by. if you lived by me, you would not talk, mr no name, not now, not ever and that is a fact, jack,.....cd is out....

Thanks for the info Joe_Friday and Jesse. Just got back from a Williams Track Center here in town where I purchased a PC78XL. Sounds great, and people tell me it talks nice therefore I am happy. Oh yes, picked up a little mag mount with an adjustable coil to tune, got it down to <1 on 1 and ~1 on 40. Just the ticket for an old fart like me who just enjoys the simple things. Thanks again.

Terry

31. Re: READ THIS EVERYONE AND POST YOUR OPINIONS!

Newsgroup: rec.radio.cb
Date: 2000-07-01 00:00:00 UTC
From: Killspieswholie@webtv.net
Message-ID: <19435-395E59EE-83@storefull-118.iap.bryant.webtv.net>
Source record: 41928

The people who participate in radio contests such as the Super Bowl, and CB radio keyup contests in general, are mindless, self esteem less literal oxygen thieves who never contribute anything to the world that would even remotely come close to warranting their presence on earth, and therefore should have never have been born.

You show me someone who thinks that hooking up a bunch of linears so that when they keyup the radio they are putting out thousands of watts requires skill or talent, and you will see a stuffed shirt windbag who has no concept what so ever of what constitutes REAL TALENT in this world. And so continues to make his way through life engaging in activities that are so worthless, so completely impossible to fail at because they require an I.Q. in the 60 to 70 range, that when they prevail and successfully key over someone, they still have achieved what amounts to NOTHING! You got that morons! NOTHING AT ALL, PERIOD!!

The only people involved with CB radio that have the breeding to mean something are the designers. Thats right chumps! Not the idiot CB radio techs, nor the human robots who build the radios, but the high I.Q. folks who DESIGN the radios! They are the only ones who have real talent, using an accurate definition of what real talent is as a marker.

So, when anyone mentions Super Stars on the Superbowl, or any keyup contest in general any where in the world, they are talking about sub standard people whose minds are so limited that it is actually a handicap that prevents them from engaging in any activities that require superior skills, or even having a decent command of the english language, and so they never have to confront their staggering limitations. Logic would dictate that you would have the odd one here and there that are capable people that do not resort to these mindless activities out of lack of intelligence, talent or self essteem, but rather, enjoy mingling by choice with those whose lack of quality breeding left them with no other choices.

There was a mention of Black linear builders.

The African race is the most parasitic and non valid of all races. Secret 30 year unbiased studies by the United States, Canada and several countries in Europe, as well as the lack of ANY ACCOMPLISHMENTS BY THE AFRICAN RACE THAT ARE EVEN OF A MINOR IMPORTENCE FROM THE BEGINNINGS OF TIME UNTIL NOW AND COUNTING HAVE CONFIRMED THIS AS ABSOLUTE REALITY! PERIOD!. They lack the breeding that would allow them to have the creative in a superior way imagination to wonder what can be, the organazation and the disciplined work ethic that would allow them to follow through to the completion of the stated goals.

One outstanding white man, like Thomas Edison, whose world class talent has provided the entire human race with quality innovations that better our lives forever, is more important and valid than all the blacks that have ever been, or ever will be, born. And that is just one white scientist, out of tens of thousands around the world.

You see, the truth of the matter is that all innovations of an advanced nature, be they: the motorcycle, car, airplane, jet propulsion, radio, real computer, classical music and the advanced instruments to play it and all types of advanced music on, boats, submarines, rockets and space flight, medical technology, radar, telephones, alternating current and the controled use of electricity, trains, the internet, lasers, masers, and all other types of advanced technology and all forms of advanced thought that brought all of our mathmatics and scientific concepts and achieved advanced goals into reality.

Blacks have not contributed any advanced technology or scientific concepts to the world. A black surgeon, who co-pioneered open heart surgery with white surgeons deserves mention.
But, he did not acheive it on his own. Typical

The white race has perfected envisioning and then making into reality all the world has at its disposal that is at the cutting edge of scientific and technology achievement from the beginning of time until the present and counting. FACT!

And please spare me the slavery phycho babble explains away all their failures blanket excuse rant. It is really very poorly thought out. The handfull of blacks that have been part of any high tech projects of any kind were their in a monkey see monkey do lower capacity.

Basicly, the black race were used as slaves because they are the closest thing you can find in the human race to absolute animals, and were used as such just as farmers would use other animals such as horses or ox for primitive manual labor.

BLACKS IN AMERICA AND OTHER PARTS OF THE WORLD OWE THE WHITE RACE FOR AN ETERNITY! WHITES OWE BLACKS NOTHING FOR SLAVERY, NOT EVEN AN APPOLOGY! EVERY BLACK IN AMERICA OWES EVERYTHING THEY HAVE INCLUDING THEIR VERY LIVES TO SLAVERY! THEY SHOULD THANK US FOR SLAVERY!! OPRAH WINFREY AND ALL THE SPORTS AND OTHER FAMOUS BLACKS WOULD NOT HAVE ANYTHING IF IT WERE NOT FOR SLAVERY! PERIOD! OPRAH WOULD BE SCRUBBING AFRICAN TOILETS FOR A DOLLAR A MONTH IF NOT FOR SLAVERY!

THEY HAVE TAKEN OUR LANGUAGE AND CULTURE, OUR SCIENCE & TECHNOLOGY, OUR TEACHING METHODS, AND ARE NOW STEALING OUR MOST PRIZED POSSESSION, THE WHITE RACES GENETICS!!!!!!!!!!!!! OUR WHITE CULTURE FORCED ON THEM, GIVE ME A BREAK!! THEY DESIRE TO BE AS WHITE LIKE AS THEY CAN BE!! LOOK AT ALL THE BLACKS WHO STRAIGHTEN THEIR HAIR AND LIGHTEN THEIR SKIN COLOR TO LOOK MORE LIKE THE BEAUTIFUL WHITE RACE!! HOW MANY BLACKS TRIED TO GET BACK TO AFRICA OR ADOPT THEIR AFRICAN WAYS AFTER THEY WERE SET FREE AS SLAVES!! NONE! THEY WANT TO BE NOT ONLY LIKE WHITE PEOPLE, BUT WITH WHITE PEOPLE AS WELL!! THEY KNOW WHEN THEY HAVE GOT A GOOD DEAL!! BRAIN

DEAD LIBERAL WHITES WHO GIVE INTO THEM EVERY TIME THEY START JUMPING UP AND DOWN AND CRYING AND PROTESTING!!

JUDGE THEM AS DIFFERENT IN A BAD WAY NOT JUST BECAUSE OF SKIN COLOR EITHER, BUT BECAUSE OF:

SKIN COLOR, SKIN TEXTURE & THICKNESS, BLACK HAIR FOR THEIR WHOLE RACE, HAIR TEXTURE LIKE SPONGE, FLAT NOSE SHAPE FROM FRONT AND SIDE VIEW, LIPS SHAPE, HEAD SHAPE, BUTTOCKS SHAPE, BRAIN SIZE, MORE PUNGENT BODY ODER AND INCREASED TENDENCY TOWARDS VIOLENT ACTIONS TO SOLVE PROBLEMS INSTEAD OF REASON. SOME BLACKS HAVE GREEN EYES AND FINER FEATURES, THANKS TO STEALING OF WHITE PEOPLES GENETICS THROUGH CROSS BREEDING.

SURE SOME BLACKS DIED BECAUSE OF SLAVERY, BUT MORE OF THEM SURVIVED VERSUS THEIR RELATIVES WHO REMAINED IN AFRICA DUE TO STARVATION, WARS AND CANABALISIM! AT LEAST THE BLACKS WHO WERE SLAVES WERE FED ENOUGH TO STAY HEALTHY SO THEY COULD WORK. BLACKS IN AFRICA HAD TO WORK MUCH HARDER JUST TO GET FOOD THAN DID BLACK SLAVES HERE IN AMERICA THAT WORKED IN THE FIELDS!

MILLIONS OF MORE WHITES DIED FIGHTING IN THE CIVIL WAR TO FREE SLAVES THAN DID SLAVES DIE BECAUSE OF SLAVERY! FACT!!

WE HAVE MANY MORE BLACK PEOPLE IN THE WORLD TODAY BECAUSE OF SLAVERY THAT WOULD BE ALIVE IF SLAVERY HAD NEVER HAPPENED!

God considered black skin so awful that he used it on some whites as a form of punishment. His actions prove that the black race is a cursed race.

These absolute truths will set those who seek to break free from the mind numbing ignorance that binds them free to see all things of any consequence as they really exist.

Of course, i could be wrong. heh heh

34. Idiot Needs Help

Newsgroup: rec.radio.cb
Date: 2000-07-01 00:00:00 UTC
From: Robin Goodfellow <k.puck@ntlworld.com>
Message-ID: <Fzt75.2495$4C4.53794@news2-win.server.ntlworld.com>
Source record: 41931

Hi,
I know that most people that seem to post to this newsgroup are from America but I was wondering if any of you could give me a bit of advice. I am from Ireland (not that I think that matters much, just different freq. if I have read up on this right) and am going on holiday in a few days, touring around the country with a few of my friends. My problem is that we are bringing two cars and it is going to cost far too much to talk to each other with mobile phones as the rates change dramatically when going between the North and South, the best solution that I could come up with was to buy a couple of radios which I thought was going to be pretty straight forward until I went into an electronics shop and was offered about 10 different options with I don't know how many different versions and brands of each. Basically we want to be able to talk from car to car with the greatest range, someone suggested cb, someone else the pmr radios and someone else suggested using amateur band. I only have a couple of days to get these and I don't know enough to tell if the shop is trying to take me for a ride, can anyone offer me some advice?

p.s.
The person that owns the other car doesn't want a radio on his roof, he wants a handheld but I have been told that they do not work too well in cars. If cb is the best choice could you tell me what sort of range I would expect to get (I know this depends on a lot of other things but I just need to know roughly). A friend says that he has an old midland, bottom of the range that has been in his room for about 5 years, is that worth borrowing or would we need better sets?

Any help will be much appreciated

35. Anybody collect radios I have these for trade.

Newsgroup: rec.radio.cb

KRIS XL-50 8 on a ten scale works fine

GE with telephone handset 9 on a ten scale

trade both for other radios,scanners,pc eqpt,etc and so on

Have pics if interested e-mail me at : sky444@mint.net

36. AM/FM/CB radio needed

Newsgroup: rec.radio.cb

From: Michael Willey <photog101@mailhost.det.ameritech.net>
Message-ID: <395E66E9.8A747792@mailhost.det.ameritech.net>
Source record: 41933

I am doing a restoration of a 1979 Goldwing and I will be using a radio housing called Cycle sound to house the radio. This comes from the same period that the bike was manufactured. What I am looking for is an AM/FM/CB radio which I can put into the housing. It does not need to have a tape player in it, but would be nice.
Can anyone direct me to any radios that would fit my needs?
Thanx in advance:
M:)

>watts, but It wont do a hell of beans on the competion bowl. Excluding
>Mother Nature that is.
>
>KRS

you want a competion , have a competion to see who can get the ferthest contact
with a 4 watt radio .

or better yet , throw a little new rule in with the "superbowl" one rule like ,

" any radio bleeding more that one channel away is DQ'ed "
" any radio modulating more than 110% is DQ'ed "

what world do you live in? There isn't a legal radio made that won't at least
bleed one channel or more depending on the distance you may be away from it.

Date: 2000-07-01 00:00:00 UTC
From: grtpmpkin32@aol.com
Message-ID: <20000630223755.21227.00000610@ng-fy1.aol.com>
Source record: 42037

I use a Cobra 2000, 10DA/TUG8 microphone, and a home made dipole antenna all the time.
4.6 watts (RMS) maximum, no noise or clutter, no bells or whistles. The clarifier has been "unlocked" by the previous owner, as have the extra channels been added.
I have to say that I'd rather use this set up over ANY export mobile set up, though there are a lot of good stations out there using such rigs. But this little low power Cobra gets out, 213 different SSB contacts in 14 different states over the last month, and not really trying either, and on a lowly dipole no less. Get 5 by 9 reports from most stations.
I'm not bragging, but I want to make a point...It's not a matter of the bells and whistles, the big guns, or the amount of money spent in setting up a station, mobile or base. It's all about clean gear, maintained and properly tuned gear, and clean audio.
The entire set up has now cost me about $300, after the used Cobra, 10DA head, and copper wire for the antenna (oh yeah and a 1:1 current balun for the dipole). Look for the good clean stuff, forget about the bells and whistles. You can save a bundle of money and have just as much fun operating.

58. Astatic Deskmicrophone help

Newsgroup: rec.radio.cb
Date: 2000-07-01 00:00:00 UTC
From: Barry <x123x123@yahoo.com>
Message-ID: <5_c75.89434$7o1.2174818@news2.rdc1.on.home.com>
Source record: 42038
Cross-posted to: alt.ham-radio,alt.ham-radio.fm,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.cb

I am trying to find a 600 ohm element for an Astatic desk microphone. I have two one is white and one is red but I am led to believe, due to the low audio reports, that the impedence is wrong. Does anyone have any info such as the color I should be looking for, if that is how you tell the impedence. Since nothing is marked on the elements I am assuming the color is the way of telling the impedence.

Thanks

Barry

I myself would have loved to get the 2000 however I did opt for a used Washington base. It does not have the xtra freq's in it however I can get out with it. Not quite as well as my mobile but that is another whole different ball of wax there..Monster mobie, little base.(not to mention it is a hellva-alot safer with a high powered mobile than base station just in case the FCC does care!!) The only thing I really wished I had with the Washington is an extra speaker that matches the set. If any one knows where I can get on please let me know.

BTW paid $95 on ebay from backyard radios...he is a fair trader and I rate him well....have not faired as well on some other deals there however.

Tim,
That was a 'close out' price, they discontinued the style.
If you were listening around 7.245, you might go back and see
what was 'behind' that mic. It, along with the $29.95 for the
mic was more than I paid for my car...

I've seen references to the RCI 2950 having 12v available on the mic
connector to allow an amplified mic. to be powered from the rig (by
way of a 9v Zenier diode).

I've checked the voltage across all the pins and can't find anything
close to 12v. Is this info in error (even on the rciweb site)?

You can work the WORLD with 100 watts on sideband. To hell with them big A.M. linears, they aren't necessary. A GOOD sideband rig, and a decent antenna is where it's at. And NO STUPID echo! Just MY opinion.

mike

Top 10 Things We Want To Hear Samuel L Jackson's Jedi Master character say in the Star Wars Prequels

10.You don't need to see my goddamn identification, 'cause these ain't the motherfuckin' droids you're looking for.

9. Womp rat may taste like pumpkin pie, but I'll never know, 'cause even if it did I wouldn't eat the filthy motherfucker.

8. This is your father's lightsaber. When you absolutely, positively, have to kill every motherfuckin' stormtrooper in the room...accept no substitutes.

7. If Obi-wan ain't home then I don't know what the fuck we're gonna do. I ain't got no other connections on Tattooine.

6. Feel the Force, motherfucker.

5. 'What' ain't no planet I've ever heard of! Do they speak Bocce on 'What'?

4. You sendin' the Fett? Shit, Hutt, that's all you had to say!

3. Yeah Chewie got a hair problem. What the brother gonna do? He's a wookie.

2. Does Jabba the Hutt look like a bitch?

1. Hand me my lightsaber...it's the one that says, "Bad Mother Fucker!"

I have a Delta force magnum that was purchased in April. I am very pleased the way it xmts but the receive leaves a bit to be desired. Now the problem is the back light flickers between bright and dim (the Lcd frequency read out does not flicker)
I have taken it back to the dealer several times and can't seem to duplicate the problem while there. Has anyone experienced anything similar or know of a fix. Like I said, I like the radio but the flickering drives me batty.

PLAN1004 - 100 WATT (PEP) WALKIE TALKIE

Make any walkie talkie get out with the power of the big guys. This tiny power converter requires less than 1 watt of driving power to create a 100 watt PEP output. Even so, the power consumption is less than 2 watts of energy, so it will operate for long periods on its small battery pack. Note: This device was designed for use in remote areas of the world and is not approved by the FCC for use on the citizens band.

Wow! That's new physics... making 100W with only 2W.

118. Re: Race issues?

Newsgroup: rec.radio.cb
Date: 2000-07-01 00:00:00 UTC
From: Jeff Herrings <president@whitehouse.gov>
Message-ID: <S4k75.7417$661.1695439@news1.rdc1.va.home.com>
Source record: 42121

Unknown Male,

1. Feel free to forward any and ALL information to @Home. I would find it rather interesting to find that they do absolutely NOTHING. You are as correct as you are incorrect.

2. Please show me where I made a "threat" either directly or indirectly as defined. Is this going to be an intellectual challenge? Unless you altered my message body, I -never- said anything other than ask a -question- as to whether or not you knew what a DOS is, which -has- happened to other persons, according to them. I cannot verify the authenticity of their statements.

3. When and how have I commited any type of fraud? "Hiding" my indentity would be to conceal my server information or any such IP addresses (that information found within a message header). On to the email address. I was never made aware that I remember reading that Outlook Express would display "president@whitehouse.gov" to anyone within Usenet. Besides, you need not be concerned with that now should you...? That is unless you are trying to send an unwelcome and rather unsolicited email to my "inbox." I believe -specifically- you were referring to the guidelines set forth under "Newsgroups" which reads and I quote:

"Forging, altering or removing header information is prohibited. This includes attempting to circumvent the approval process for posting to a moderated newsgroup."

I dont believe I modify, stupified, re-arranged, altered or removed any header information. Its all right there in the open. Actually, I don't believe this is a "moderated" newsgroup.

4. "Cracker" has much more meaning other than the commonly -assumed/slang/term given to white with intent to express prejudicism- and that would be my friend:

Main Entry: crack&#65533;er
Pronunciation: 'kra-k&r
Function: noun
Date: 15th century
1 chiefly dialect : a bragging liar : BOASTER
2 : something that makes a cracking or snapping noise: as a : FIRECRACKER b : the snapping end of a whiplash : SNAPPER c : a paper holder for a party favor that pops when the ends are pulled sharply
3 plural : NUTCRACKER

4 : a dry thin crispy baked bread product that may be leavened or unleavened
5 a usually disparaging : a poor usually Southern white b capitalized : a
native or resident of Florida or Georgia -- used as a nickname
6 : the equipment in which cracking (as of petroleum) is carried out
---

So, you see; I was in fact calling you "a dry thin crispy baked bread
product that may be leavened or unleavened." I really don't see the racism
in that, perhaps you are right and my ISP will.

5. As far as this letter where I supposedly state that you should be
"arrested" or however it was you put it. Well.
Seeing you revert to comical insinuations is hilarious.

6. Did you really think I sent that email with intent on getting your
account disabled, as suggested when I mentioned, "That is assuming by now
that you can...." You simply swung at the pitch. You bit the line.

7. We could CERTAINLY continue this back and forth if you wish.... that
choice is yours.

8. Be aware that you are defaming my character by spreading rumor that I
threatened you in ANY way. Any and all feelings regarding my alleged
"threat" are pretensious.

Jeff

PS - I have this strange feeling that you may be a SysAdmin. Despite
whether or not I am correct, I myself don't feel like having a battle of the
SysAdmins. That is (not sure of your specific cert's) MCSE+I, MCT, CNA,
CCNP, A+. Though, I'll stick to what I said before, that choice is yours.
Please point out any further mispellings as Outlook Express doesn't have its
spell checking option installed.

Unknown Male wrote in message ...
>Jeff,

I think the fact that we haven't heard anything more on this... means that
there wasn't much substance to this mod... if you know what I mean.

Sure I will. Why, are you scared now? Think that two can play this game?
You make a racist statement about me, because I made a racist statement.
You went and cried to my ISP, and now I am doing the same. What's wrong
Jeff, can you dish it out but not take it?

I did not alter your message body. It's still on usenet servers all over
the world for anyone to see. You asked if I knew what a DOS was, but there
was no point in my answering because I couldn't. Sure I know what a DOS is,
I can name at least two dozen if I wanted to. What did you do, SYN flood my
box? Or how about a good old Smurf? Maybe you are a few years behind and
are still using Teardrop, Newtear, Bonk, or just good old ping -f.

> "president@whitehouse.gov" to anyone within Usenet. Besides, you need not

Ok, this is the first point where you are incorrect about Outlook Express.
Follow along, if you will, and I will point out your second lack of software
knowledge in just a second.

> be concerned with that now should you...? That is unless you are trying
to

> believe this is a "moderated" newsgroup.

Who said this is a moderated newsgroup? Can you "stupify" a newsgroup post? What in the world are you talking about? Have you lost your mind? Earth to Jeff, Earth to Jeff, come in Jeff. Enough of the rambling, OK?

>
> 4. "Cracker" has much more meaning other than the
> commonly -assumed/slang/term given to white with intent to express
> prejudicism- and that would be my friend:

Umm, sure. We know that you used the term cracker to refer to my "whiteness" in a rather bigoted racist type of way. Furthermore, let's go to

> http://www.dictionary.com/cgi-bin/dict.pl?term=cracker

and look up the definition of cracker again. It says:

crack•er (krkr)
n.

A thin, crisp wafer or biscuit, usually made of unsweetened dough.
One that cracks, especially:
A firecracker.
A small cardboard cylinder covered with decorative paper that holds candy or a party favor and pops when a paper strip is pulled at one or both ends and torn.
The apparatus used in the cracking of petroleum.
One who makes unauthorized use of a computer, especially to tamper with data or programs.
Offensive. Used as a disparaging term for a poor white person of the rural, especially southeast United States.

Funny to me, you did not list the last one. Now that I read the definition, I almost fit the full description. I am white, I live in a rural area, and in the southcentral US. However, the "poor" part does not apply here.

For those of you following along at home, here is Jeff's modified dictionary's look at the word "cracker",

>
> ----------
--
> ----------
> Main Entry: crack&#65533;er
> Pronunciation: 'kra-k&r
> Function: noun
> Date: 15th century
> 1 chiefly dialect : a bragging liar : BOASTER
> 2 : something that makes a cracking or snapping noise: as a : FIRECRACKER
b
> : the snapping end of a whiplash : SNAPPER c : a paper holder for a party
> favor that pops when the ends are pulled sharply
> 3 plural : NUTCRACKER
> 4 : a dry thin crispy baked bread product that may be leavened or
unleavened
> 5 a usually disparaging : a poor usually Southern white b capitalized : a
> native or resident of Florida or Georgia -- used as a nickname
> 6 : the equipment in which cracking (as of petroleum) is carried out
> ----------
--
> ----------
>
> So, you see; I was in fact calling you "a dry thin crispy baked bread
> product that may be leavened or unleavened." I really don't see the
racism
> in that, perhaps you are right and my ISP will.

Please, refer to the previous paragraph.

>
> 5. As far as this letter where I supposedly state that you should be
> "arrested" or however it was you put it. Well.
> Seeing you revert to comical insinuations is hilarious.

Supposedly? Oh, Cut and Paste is so cool, that is, if you know how to do
it. If not, Jeff, let me know and I will teach you how. Your comments
were:

<snip>
"I am sure you will agree that he/she is in direct violation of any company
rules and regulations and/or law set forth. This user should be found
guilty of breaking a "hate law."
</snip>

I should be guilty of breaking a "hate law." Now, while my common sense
tells me to start explaining hate laws to you, I'm not going to do it,
because it would take another 15 minutes.

>
> 6. Did you really think I sent that email with intent on getting your
> account disabled, as suggested when I mentioned, "That is assuming by now

> that you can...." You simply swung at the pitch. You bit the line.

Assuming that I could answer the post was because, according to you, a DOS was being done to my box. Remember? You are the one that said:

"Hey there tough guy... do you happen to know what a Denial Of Service is?
Just curious.. no need to respond..
That is assuming by now that you can... take it easy there cracker.."

That paragraph speaks for itself.

>
> 7. We could CERTAINLY continue this back and forth if you wish.... that
> choice is yours.

Whatever floats your boat.

>
> 8. Be aware that you are defaming my character by spreading rumor that I
> threatened you in ANY way. Any and all feelings regarding my alleged
> "threat" are pretensious.

I am not defaming your character. I am simply repeating what you stated, and interpreting it as, based on my internet experience, it is usually meant.

> CCNP, A+. Though, I'll stick to what I said before, that choice is yours.
> Please point out any further mispellings as Outlook Express doesn't have
its
> spell checking option installed.

Why do you believe I am a sysadmin? Because I am now cowering in a corner and hiding from you? You would think that someone that is MCSE certified would know a little more about Outlook Express than you do, since it does have a spell checker. You can invoke it by going to "Tools" then to "Spelling" when you are composing a message. For the more menu-retarded, such as yourself, you can simply press the "F7" key to get it going. If you look right about your letters, (like ABCD, etc), there is a row of numbers. Numbers are like 1, 2, 3, 4, etc. Above those numbers are what we call "Function Keys." Press the one that looks like "F7" and you will be mysteriously, almost magically, spell checked. Pretty neat, huh?

A battle of the sysadmins, let's see... to have a battle of sysadmins, that would mean that you would have to be a sysadmin. Having root on your own box doesn't make you a sysadmin. Have you ever booted to linux before? You should try it sometime.

If you are trying to find the resonant frequency of the antenna, attach the PL259 on the coax to the analyzer, turn it on, set it for the band you are checking, and turn the knob until the swr meter zeroes out, and that is the frequency at which the antenna is resonant. Very simple. Now, if the antenna isn't where you need it to be, then you need to adjust the length of the antenna and recheck.

>Follow along, if you will, and I will point out your second lack of
software
>knowledge in just a second.

Oh there kind sir of software. I will quote what -IS- presented in Outlook Express 4.0 (as you can tell within my header, which is what is NOT to be altered as per my ISP's terms of service):

"People can reply to your new messages either by posting another news message or by sending you and e-mail message. Your email address is the address they use to send e-mail messages to you. This address has been assigned by your Internet service provider."

Nowhere am I notified that a correct email address is to be entered, that is specifically that MINE should be entered. If you know my ISP and their domain, simply put my full name in front of that domain.. that will get you my true email address. It is a most common anti-spam technique. You should know as you are supposedly: "Unknown@unknown.com" or did you overlook that fact? Again, nowhere did I alter my header information nor modify it in such a way to divert someone from finding who posted my message(s). So there you go again, making something of nothing.

>> I dont believe I modify, stupified, re-arranged, altered or removed any
>> header information. Its all right there in the open. Actually, I don't
>> believe this is a "moderated" newsgroup.
>
>Who said this is a moderated newsgroup? Can you "stupify" a newsgroup

post?
>What in the world are you talking about? Have you lost your mind? Earth
to
>Jeff, Earth to Jeff, come in Jeff. Enough of the rambling, OK?

I'm here.. are you? You must certainly be somewhere else if you wish to
play games and make it as if I am the ignorant one here. Obviously we know
who actually IS.

>
>>
>> 4. "Cracker" has much more meaning other than the
>> commonly -assumed/slang/term given to white with intent to express
>> prejudicism- and that would be my friend:
>
>Umm, sure. We know that you used the term cracker to refer to my
>"whiteness" in a rather bigoted racist type of way. Furthermore, let's go

Really? That was without a "doubt" a racist comment? So you would further
defame my character by assuming that I would reply to your post in manner
such as yourself? I dont think so.

>to
>
>> http://www.dictionary.com/cgi-bin/dict.pl?term=cracker
>
>and look up the definition of cracker again. It says:
>
>crack&#65533;er (krkr)
>n.
>
>A thin, crisp wafer or biscuit, usually made of unsweetened dough.
>One that cracks, especially:
>A firecracker.
>A small cardboard cylinder covered with decorative paper that holds candy
or
>a party favor and pops when a paper strip is pulled at one or both ends and
>torn.
>The apparatus used in the cracking of petroleum.
>One who makes unauthorized use of a computer, especially to tamper with
data
>or programs.
>Offensive. Used as a disparaging term for a poor white person of the rural,
>especially southeast United States.
>
>
>Funny to me, you did not list the last one. Now that I read the
definition,
>I almost fit the full description. I am white, I live in a rural area, and
>in the southcentral US. However, the "poor" part does not apply here.
>

>For those of you following along at home, here is Jeff's modified
>dictionary's look at the word "cracker",

For those "following along" (again he is assuming you are all interested),
visit the website that -I- actually visited.. something he failed to ask
me... I naturally went to the "king of dictionaries", one that MOST Im sure
would have gone to first:

http://www.m-w.com/cgi-bin/dictionary

Then type in "cracker" without quotes and you will see that I copied word
for word (or verbatim for "Unknown").

>
>
>>
>> ----------
-
>--
>> ----------
>> Main Entry: crack&#65533;er
>> Pronunciation: 'kra-k&r
>> Function: noun
>> Date: 15th century
>> 1 chiefly dialect : a bragging liar : BOASTER
>> 2 : something that makes a cracking or snapping noise: as a : FIRECRACKER
>b
>> : the snapping end of a whiplash : SNAPPER c : a paper holder for a party
>> favor that pops when the ends are pulled sharply
>> 3 plural : NUTCRACKER
>> 4 : a dry thin crispy baked bread product that may be leavened or
>unleavened
>> 5 a usually disparaging : a poor usually Southern white b capitalized : a
>> native or resident of Florida or Georgia -- used as a nickname
>> 6 : the equipment in which cracking (as of petroleum) is carried out
>> ----------
-
>--
>> ----------
>>
>> So, you see; I was in fact calling you "a dry thin crispy baked bread
>> product that may be leavened or unleavened." I really don't see the
>racism
>> in that, perhaps you are right and my ISP will.
>
>Please, refer to the previous paragraph.
>

I have referred to it. I still don't see you point.

>
>>
>> 5. As far as this letter where I supposedly state that you should be
>> "arrested" or however it was you put it. Well.
>> Seeing you revert to comical insinuations is hilarious.
>
>Supposedly? Oh, Cut and Paste is so cool, that is, if you know how to do
>it. If not, Jeff, let me know and I will teach you how. Your comments
>were:
>
><snip>
>"I am sure you will agree that he/she is in direct violation of any company
>rules and regulations and/or law set forth. This user should be found
>guilty of breaking a "hate law."
></snip>

Oh Lord. "This user should be found guilty of breaking a "hate law.""
Funny how that just doesn't seem to go along the lines of my style of
writing displayed within this newsgroup or anywhere else for that matter.

>
>I should be guilty of breaking a "hate law." Now, while my common sense
>tells me to start explaining hate laws to you, I'm not going to do it,
>because it would take another 15 minutes.
>

No need. I -am- certainly aware of "hate laws" and if I were not, I would
CERTAINLY educated myself to become familiar with such.

>
>>
>> 6. Did you really think I sent that email with intent on getting your
>> account disabled, as suggested when I mentioned, "That is assuming by now
>> that you can...." You simply swung at the pitch. You bit the line.
>
>Assuming that I could answer the post was because, according to you, a DOS
>was being done to my box. Remember? You are the one that said:
>
>"Hey there tough guy... do you happen to know what a Denial Of Service is?
>Just curious.. no need to respond..
>That is assuming by now that you can... take it easy there cracker.."

>
>That paragraph speaks for itself.

Still don't see it my friend. Sorry you are trying to make something out of
nothing. You truly must be bored. "do you happen to know what a Denial Of
Service is?" -HARDLY- constitutes a threat. I was simply asking for the
better of educational purposes. I was also hinting that such "actions" have
taken place among users in this particular newsgroup before, according to
the stories of which I had no involvement. Besides, we BOTH know that a DOS
can be traced, atleast that is what the text on "Denial Of Service" on a web
site I visited said.

Still trying to make something of nothing.

>
>
>>
>> 7. We could CERTAINLY continue this back and forth if you wish.... that
>> choice is yours.
>
>Whatever floats your boat.

Well, then I must be just sailing along.

>
>
>>
>> 8. Be aware that you are defaming my character by spreading rumor that I
>> threatened you in ANY way. Any and all feelings regarding my alleged
>> "threat" are pretensious.
>
>I am not defaming your character. I am simply repeating what you stated,
>and interpreting it as, based on my internet experience, it is usually
>meant.

There you go. You are interpreting things all wrong then. Interpretation
can be a "wild" action. If you wish to continue with your insinuations,
interpretations and assumptions, then feel free. You are obviously more
than able and free to do so.

>
>
>>

>and hiding from you? You would think that someone that is MCSE certified
>would know a little more about Outlook Express than you do, since it does
>have a spell checker. You can invoke it by going to "Tools" then to

A spell checker that is an OPTION to install. Mine is NOT installed.
However, you again assume I am a MCSE. I never stated I was a MCSE.
Whether or not I am, well, Im sure you could find out if you wanted to.

>"Spelling" when you are composing a message. For the more menu-retarded,
>such as yourself, you can simply press the "F7" key to get it going. If
you
>look right about your letters, (like ABCD, etc), there is a row of numbers.
>Numbers are like 1, 2, 3, 4, etc. Above those numbers are what we call
>"Function Keys." Press the one that looks like "F7" and you will be
>mysteriously, almost magically, spell checked. Pretty neat, huh?
>
>A battle of the sysadmins, let's see... to have a battle of sysadmins, that
>would mean that you would have to be a sysadmin. Having root on your own
>box doesn't make you a sysadmin. Have you ever booted to linux before? You
>should try it sometime.

Wow. Are you one of those mid-lifed crisis type that are just now learning
Linux or any *nix based OS. Are you referring to Solaris, FreeBSD, Linux
(RedHat or Slackware flavor), SCO, etc, etc.

Next you will want to try to educate me on what a DNS or WINS server is. Or
perhaps you want to teach me how to properly configure a Cisco NAT, or do
you want me to know what RIP is? Give me a break pal. You're funny.

>>in the southcentral US. However, the "poor" part does not apply here.

>>

I just took notice of a contradiction. According to you I made a "racist" comment by calling you a "cracker." Wellllllll, even if I meant a "poor white person of the rural, especially southeast United States," that in itself is NOT racist. However, I still think you are a dry thin crispy baked bread product that may be leavened or unleavened.

However, lets look up the word that YOU used. Which is CLEARLY define as a racial slur:

Main Entry: nig&#65533;ger
Pronunciation: 'ni-g&r
Function: noun
Etymology: alteration of earlier neger, from Middle French negre, from Spanish or Portuguese negro, from negro black, from Latin niger
Date: 1700
1 usually offensive, see usage paragraph below : a black person
2 usually offensive, see usage paragraph below : a member of any dark-skinned race
3 : a member of a socially disadvantaged class of persons <it's time for somebody to lead all of America's niggers... all the people who feel left out of the political process -- Ron Dellums>
usage Nigger in senses 1 and 2 can be found in the works of such writers of the past as Joseph Conrad, Mark Twain, and Charles Dickens, but it now ranks as perhaps the most offensive and inflammatory racial slur in English. Its use by and among blacks is not always intended or taken as offensive, but, except in sense 3, it is otherwise a word expressive of racial hatred and bigotry.

Or is it? See... "Personal interpretation" can be a funny thing.

At any rate. I already made @Home aware of my email to your ISP, the REAL one that is. I also describe in detail what I said and so forth. I'm still here. Take care friend.

Jeff

Thank you all very much for the great participation in IR World Contest.

Please do not forget the calculation of the points has to be done
by the participants. So fill out the TABLE OF RESULTS
and send it in together with your log sheets.

Read carefully the contest rules there you find all info how to do it.
Single logs sent in without TABLE OF RESULTS will not be valid.

Many thanks to everyone who took part
and made the IR World Contest a great success.

Please note: Contest Manager does not mean QSL Manager!!!
So please do not send any QSLs to the Contest Manager!!!

Yes the voltage is steady, I'm using an Astron 35 amp 13.8 volt power supply and even switched to a different power supply with the same results. Its not a continous flicker, It can go hours without flickering or and can start as soon as I turn the radio on and last for a few minutes or so. I should add that the reception is staticly while this is happening. I have checked all of my connections????

Man, this really sucks:

Deja.com, formerly DejaNews, has unplugged four years of newsgroup archives.

Read about it.
http://www.salon.com/tech/log/2000/06/20/deja/index.html

http://www.zdnet.com/zdtv/screensavers/interact/story/0,3656,2590504,00.html

We are losing a really great resource here ..... Sad!

Amateur is out. You don't have GI/EI licences. For your purposes, get a pair of the cheapest CB's you can find and then spend a little more for some decent magnet mount antennas you can use on your vehicles or rentals. They should handle a few kilometers between the two of you and if it gets a little noisey, tell your bud to slow down and let you catch up!

You're the little puke not worth anybody's time... whats wrong there
Patrick... You made the threats arent you going to make "good" of them...
You're such a pity.

>
>By the way, there is an Outlook Express 5 available, it has been for about
a
>year now. Perhaps you would like to upgrade.

Windows 98 was out for quite sometime also... but.. how many REAL IS persons
do you know that were euthusiastic about upgrading? You truly dont know
anything worthwhile about computers. You are just some looser that has a
linux box, so know you think you are the man. Give me a break. I've seen
more IT situations than you or anyone else would probably WANT to see. Also
keep in mind, I have this IBM capatible along with 3 others (one a dual 750
with NT on it) then a Sparc 10 and a Indigo P^2. Though, I have probably
blasted right past your intellect at this point.

>

Source record: 42082

damnit hit the send key on accident , i will start over

in a key down there is a station listening and recording the key'ers right .... well then . that station which i assume is at least skipping distance away . lets say 250 miles . if that station can hear bleedover from the key'er one channel away , that keyer is DQ'ed

on any day i can hear stations on 6 , 11 , 20 constantly bleeding over me , one that stands out is " bugga-man " on 20 . i am in illinois he is in the south somnewhere , i hear him on 21 and 22 all the time .

sure a an 8 pill the modulates about 300% will be heard at a distance but it also splatters like so much shit on a fan .

impress me by having a good sounding not overdriven over modulated rig. on 21 the other day some guy from alabama , i was relaying between him and 1935 .he sounded as strong if not stronger than any one on 6 , 11 , 20 . and he had some sweet audio , not over driver , no splatter .

> The galaxty 88/ 99 both basically same radios ! diffrent on face-
the 88 has push buttons for most functions ,,, the 88 does have small
meter.
The 99 has large meter , better operator controls in mobil
application compared to the 88s push buttons,,,
As for tune ups ,, same on both radios , if tuned properly ive seen
as much as 50 wats out of stock radios , and yes YOU CAN make it both
88-99 run on cb freq, very easy ,
personaly Ive never seen any problems with either radio ,, just depends
on how you like you radio to operate push button turn knobs ????
good luck

You should be a bit more specific in your requirements....
IE: price range, am, am/ssb, basic features, full featured, Export type radio, legal cb....

My opinion differers somewhat from gunsmoke, If I were to form an opinion without any further information on your requirements, I would say typically The Uniden Radios would be the best choice, Cobra WAS certainly a top contender, however they have recently quit having UNIDEN manufacture some of the Radios for them (Uniden manufactured MOST of the Cobra radios in the past) Since this makes it difficult for the average person to be certain they are getting a quality Uniden product my recommendation would be to purchase an actual Uniden brand radio. There are many other quality choices available, if you would be a bit more specific on your requirements I as well as others could give you a more definitive answer..

165. SWR Problems - Finally Fixed !

Newsgroup: rec.radio.cb
Date: 2000-07-02 00:00:00 UTC
From: mr_anonymous@bigfoot.com
Message-ID: <8F65F4F5Anonymous@207.126.101.100>
Source record: 42095

Last time I posted I mentioned how on my Ford Ranger my SWR was horrible. Numerous ideas were suggested. The final solution was cutting a hole the size of the antenna mount in the bedliner. Then I had the area on the bed where the antenna mount would go filed down so that the mount bolted flush to the bed. Result - 1.5 on CH 1, 1.3 on CH 40. Not the best possible I know, but a heck of alot better than 3.5! :-) I can live with this SWR, but in the pursuit of perfection, any ideas what I could do to go down to 1:1 on all 40 channels? Thanks to everyone for all the suggestions on my previous SWR problem !

<< what I could do to go down to
1:1 on all 40 channels? >>

a perfect 1:1 is really unheard of unless you fool the meter with about 100
feet of cable .

i just got a president penn. and have 1:1.1 on 40 &1 and a snidge lower on 20
. before that with my wilson5000 i was 1:1.4 to 1:1.3 .

at 1:1.5 thats only a 3% power loss if i remeber right . thats not bad at all
. rather good i would say

The updated version of the A-99 is the Imax99. That may be a better choice.
I've had (2) ABS1600's, both defective.
I do NOT recommend the available groundplane kit for the A-99, it only
increases your bleed on neighbors and yourself.
An A-99 with a MACO groundplane works well, and don't skimp on coax. Times
LMR400 isn't that expensive, and may be the last coax purchase you'll make.

12 volts isn't there, but you can put it there by using one of
the up or down terminals....I wouldn't use 12 volts , I would go
for the reg. 8 volt sorce. that way you could use a 9 volt
mic. they work just as well on 8 volts..

rf feedback has always been a problem with the 2970's....make
sure everything is grounded good. ground everything to each
other and then a good earth ground. sometimes you have to
ground the mic to the chassis of the radio, if its a d-104.
also ferrit beads on the audio lead at the mic plug will help...

You could have a near perfect swr reading across the entire band at a stationary location if you could use a very broad-banded antenna such as a full wavelength dipole, but for a mobile you have achieved perfection for all practical purposes, unless you want to set up two antennas and feed them through a coax switch, tuning one for the low end of the band and the other for the high end of the band, but then that would be overkill.

Where (can you/did you) get an Astro Plane antenna today? Is this the same
Astro Plane antenna design from back in the early 1970's that I remember?
Or is it a new and different one?
I currently use the Shakespeare 5/8 wave Army Big Stick and it is working fine.
But it seems to be more flimsier than the old 1/2 wave Original Big Stick that
it replaced.

Who sells the Astro Plane and for how much is it going for these days?

Thanks.

Not so sure about that..The Dave 5 pill I`ve been using everyday for 2 years blows away the "New one" I got from Joe....The older boxes where built different.They had alot more room for mods and the transformers had better wrapping

I hope I did`nt brain my damage.

How on earth can you say that these Made in China cheapened up Cobras are the best? They ARE the best IF you want to buy inferior slave labor made JUNK QUALITY compared to the Unidens, which are newer modernized versions of the Old Cobras that they USE TO build! Today you buy a radio for what it says ON the box or the back of the CB, NOT what the name brand is. IF it says Made in China on it, you can be sure that it IS JUNK and don't buy it or you may be sorry! Plus you won't be lied to on bogus new "features" like SCAM Tracking (Sound Tracker) and you'll pay more for the defunked name on it instead of buying QUALITY.
IF you don't believe this CB tech/ salesman/ field tech 1 man operation of 21 years this week, then I think you should buy BOTH the Cobra 29 and the Uniden PC-78. OPEN each unit up and just look at the parts on the board and see how the quality is lacking in the Cobra. You will then quickly throw the 29 in the trash can and use the 78 because you can see, smell & feel the quality in the Unidens as compared to the Cobras. And you will avoid potential problems that you probably will get with Cobra in the future, because those less quality made units will show in problems down the road!

I hope you take this as ONLY being "My Opinion" Ive collected,fixed,traded,& sold radio's for 25 year's, and ive found the cobra 2000 as being a far inferior radio in the receive catagory. It suffers from bleedover terribly, its a great talking radio, nice looking BUT if its all mouth and NO ears........what good is it? Ive also had the Galaxy Saturn Base......its far better on receive, ALMOST as good in talking, and it at least has a "True" freq counter in it. I ALWAYS reccomend older "Vintage" sets to people getting into the c.b. hobby, Like a Tram D201/Tram D201-A, I feel they are leaps and bounds ABOVE ALL other radios, in ALL catagories, BUT they are kind of pricy if their in good condition. Whatever you choose I wish you luck with, and I welcome you into the BEST HOBBY in the WORLD.............Regards, Frank.

American Frank:
"Fear GOD, and Keep HIS Commandments, for THIS is the DUTY of MAN," it says in the last 2 verses of Ecclesiasties. The purpose of Elian staying here is to get him away from turning into a "little Communist." I and millions of Americans agree with you about helping people HERE AT HOME instead of all the international UnConstitutional nonsence. But I'm afraid that the MEDIA and THE GOVT. manufactured this whole fiasco they drummed up to LEAD IT UP to DROPPING the BARRIER on CUBA !!!!!! They IGNORED the principal of Law that says IF someone dies getting you here, YOU CAN stay. GOD will judge them for that, for sure. George Washington said "STAY OUT of the AFFAIRS of Europe. This July 4th lets think of what the Founders of this country did to get us away from the Europeans to make us FREE. It is YOUR job to teach the Native born Americans to be VIGILANT. "It can't happen here" is a statement that YOU KNOW that IS a LIE, because your Hungarian heritage shows you it is!!!!!
Dave!!!!!!!!!!!!!!

JJ475171 wrote in message <20000629213756.04297.00000796@ng-ff1.aol.com>...
Big deal I say, The United States Government spent one million eight hundred thousand dollars on him, his family, bringing his classmates here, his school
teacher, and his step mother. When was the last time the U.S.A spent that kind
of money on a senior citizen because he/she could not afford to live.....or when was the last time the govt shelled out surplus money(OUR MONEY) back to us
in a usefull manner.....NEVER !!!!! When my parents came here in 1956 (DURING THE REVOLUTION) in Hungary, no-one at all reached out a helping hand
to help them out!!!!! NOW a days any damn foriener can come here and gets TONS
AND TONS of fianancial assistance from the U.S.A.....its not fair, and in my
opinion, the u.s.a has enough problems of its own, worry about them FIRST before they worry about some little god-damned little communist ! Im a very fair, open minded, and kind guy, but im sick and tired of all this god-damned
garbage going on. We the citizens of the U.S.A. should ALL be god-damned millionaires, after all THIS IS THE RICHEST COUNTRY IN THE
WORLD.....take care of US FIRST!!!!!!!! Best Regards to ALL AMERICANS.
Frank.

I'll agree with the fact that most 2000's have no kind of bleed rejection at all. I've talked on many belonging to other people and they are a real horror to use when there is tons of DX and locals talking. The guy who repaired my 2000 for me (freebie radio, needing a $25 fix) installed an additional crystal filter for me. He said it was something he was curious what the results would be, and didn't charge me for it. I'm absolutley amazed at how well it works. Most 2000 GTL's, when you turn on the noise blanker the bleedover almost doubles. Mine doesn't do that at all, and I'd say it's actually just about as good a reciever as my Tram Titan with the Collins mechanical filter.

Another very good SSB rig is an SBE Console V. It does good power, has pretty good recieve, and has a really cool squelch meter. They will also do plenty of upper channels.

Anon,

Your SWR is as "perfect" as it needs to be. Going from 1:3 down to 1:1 isn't worth the trouble. No station would be able to detect the difference!

J

If I'm not mistaken they are the same radio inside. The Cobra Nigtwatch looks better in the dark (and in the light actually) than the "light pipe" that the Unidens use. Performance should be equal so it's really a matter of appearence.

<16451-395B8E5A-10@storefull-116.iap.bryant.webtv.net>...
Elians mother & father created him. His mother, who took him out of the

No, GOD created him. His father was divorced from his mom,
which did the RIGHT thing in trying to get him out of that SLAVE STATE
called Cuba. Imagine a country so bad that people have to risk life to get
out of! Come to think of it, didn't they do the same thing in 1776 ? In
1420 ?

country illegaly is dead...so he belongs with his father, who gave him

Anything you do against Communism is "illegal" but not UNLawful
under God's Law. His mother HAD custody of him, so he belongs with his
Miami relatives. People fleeing Nazi Germany were doing it Illegal under
your thinking!

life. In reality, Elians father is the only person who ever had the
moral right to decide where his own son should live.

It is IMMORAL to want to live in a Communist country when one has
the chance to get out! He was divorced from his wife that had custody.
What do you think that GOD will do to a country that rejects a stranger in
favor of communism, and ignors CASE LAW that says that you get to stay if
someone died to get you here? Communism is an AntiChrist religion.

Now, if it had been reasonably proven that Elians father was an unfit
parent for whatever reasons, barring U.S. Cubans understandable,
(especialy after having made permanent homes in the United States) but
none-the-less bias toward Castros Cuba that colors and taints their veiw
regarding all things Cuba, including a single parent, who is gainfully
employed, who loves his son enough to come to the United States and put

I think he was a pawn to have the trade barrier brought down for
Cuba!
He has a new wife or girlfriend, don't he?

up with this media & political driven absolute non-sense to collect him
and take him back home so he can prove his ability to raise his son to
the world.

As the Hungarian said, "to make him another little Communist."

The proof that the father is an unfit parent never emerged. However,
that the mother would endanger her small childs life attempting such a

trip, because her boyfriend pushed her into it, speaks volumes about her

No, she had GOOD judgment. Escaping from tyranny and a Communist country is BAD judgment? YOU should go there & see your words false!

poor judgement. Judgement so poor she could not envision all possible hazards...and therefore lost her life. At least the father is trying to make a decent life for his son, without getting himself or elian killed in the process.

You CAN NOT have a decent life in a Communist country (ask the Hungarian). With the increase of Communism here in the USA, it is geting hard to have a "decent" life here. The founding Fathers fought to give US a "decent" life. What are WE going to do to keep it from getting away from us?

The U.S. intelligence services checked out pop...he can provide reasonable food, shelter, and medical care for his son.

They are as communist asd bill clinton and therefore NOT intelligent!

Social considerations? Schooling? Looking past the word communist you will find that schools in Cuba are much better than you would think. Yes

What liquor have you been drinking? Government schools is plank # 10. Nothing under Communism is better than what we had here before '58.

they spread dis-information...but so do schools in the United States, they just hide it better. And at least the schools in Cuba do not adhere to that hidious political correct phenomenah known as social promotion.

They have WORSE promotions--children of the party members ARE the elite! Why do you love dem commies? GO THERE !!!!

Elian is finally back with his father...which is where he should have been returned to immediately after his rescue and medical testing.

No I don't think so. Returning a slave back to the commune is what another slave would want. Making him FREE is what an AMERICAN would want. I have to say I'm sorry to all the Cubans for the sad estate this country is in to AID communists worldwide since 1945 ! 2 Chron. 7:14 is the answer. Will YOU repent?

Could you please tell us what was defective and under what
circumstances the defects occurred with your ABS-1600's?>>

The first was fine under radio power, then applied 300w and swr slammed.
The second showed acceptable swr, but had poor tx and rx (as in less the half
that of an 8yr old A-99).
Bought an Imax 2000 and have had no troubles.

Hey Buck,
Why don't you spend your grrenbacks on some GOOD radio gear like
Kenwood, Icom, Yaesu, Alinco, etc.? These rigs can be modded for 11-meters,
and will simply SMOKE the hell out of the CB stuff, especially on sideband.
And...they go from 500KHz-30MHz so you can even listen to shortwave and
broadcast radio!!! And if you ever do decide to get a ham 'ticket', you'll
already have the radio...
Just MY 2 cents. I don't mean to critisize you in ANY way.

I'm not talking about a CB sales clerk in a corporate CB shop or someone that is forced to because he works at a truckstop. I am talking about a "little man" CB shop OR owners of big corporate sales distributors and big time CB distributors like Gold or Copper or Tin or Straw and buyers that have made the decision to KEEP selling these Made in China CB's? Can they get busted for violating the "trading with the enemy act?" That is what you are doing when you purchase for resale these brand new RED CHINESE slave labor made jack booted thug government that permits these CB's to be made there CB's !

Have a "happy" 4th of July. I know that you won't if you keep supporting OUR enemies! Maybe they will NUKE your town, along with LA too. Maybe then you will realize that Lenin was talking about YOU when he said that the capitalists are so stupid that they will sell US the rope to hang them with!!!!!
Dave!!!!!!!!! (sugar coat it if you like, but STOP selling Made in China CB's)!

Yep you bet, it can go anywhere on the cb band! The radio is a great talker! Dave/Debbie has a very biased opinion, he lets personal views enter his judgement! I personally own 2 Deltaforces, have sold 30+ of them No problems! The company is great to deal with! Thr radios only fault is it has a noisy recieve, some folks say its just oversensitive.......

From: killrwat <killrwat@dwave.net>
Message-ID: <395fefe4$0$8317$4bb17d6e@news.dwave.net>
Source record: 42232

Ed, Dave is a very biased person of questionable Technical background.
He constantly Spews Anti-communist crap, and basically rambles on! just
search Deja for his postings!

RF Limited is the company that puts claim to the Deltaforce, They
answer emails quickly and seem to stand behind the products much better than
other companies I've delt with, I should not say I've never had a problem
with ANY Deltaforce, I did have one that the glue let loose on the
faceplate, it was quickly and professionally replaced by RF Limited.. I've
had problems with some of there other products over the years and they've
always been Exceptional in there service.....

Now onto the Deltaforce Eval......

This opinion is based upon my 30+ years in radio, and 25+ servicing, I've
had both formal, and informal electronics instruction, However I do
continue to learn every day!

Ok, First, The Deltaforce after a simple Modification covers
25.165-29.695, this of course covers the entire CB band! It has channel
display as well as frequency display, including the "A" channels 19A etc....
The radio has the best ALL MODE talkback and Echo I've found in a radio yet!
The radio does AM/FM/SSB/CW, The transmit is also one of the best i've found
SO FAR! The Delta force radios Have variable power output, And out of the
box mine have all been 30+ peak watts, After a little work my personal
radios see nearly 70 peak watts as read on a Bird 43P wattmeter @ 14 volts.
The receive is noisy, However the transmit more than makes up for it! The
AM audio on this radio is simply Awesome! I've set my radios power to vary
from .5 watts to 9 watts dead key, They will dead key .5 watts and get the
bird near 70 watts. Again the 70 watt figure is NOT a stock radio... I run
a Ford Bronco with 18.5x44 Super Swamper tires, these tires vibrate
massively @ 65 mph, the radios have had no problem with vibration! If RF
Limited manages to quiet the receive I would give the radio a 10, right now
due to the receive i rate it a 8.5+
If you like the features, you'll LOVE the radio! Now i'm sure that RF
Limited occasionally sees a bad radio returned, I think most any
manufacturer would! However of the 30+ units in my area not one has had
any problems, and not a single one has come back on trade, everyone I know
boasts about the radio....

This is not the first time the Deltaforce question has come up here in
the NG, there are others on the NG that will confirm my Evaluation of the
radio... Up to "DAVES" post on the radio I have NOT seen a negative report
on it.. Considering The source I won't even count it!

Don't just listen to one opinion, leave some of the others on The NG
respond, when you do decide to buy one let us know if you like it as well as
i think you will....

If you have any SPECIFIC questions on the radio feel free to email
me....

Probably not possible to achieve a 1:1 SWR across the band without a tuner, and particularly for mobile operation. What most of us do is pick a Channel (band, frequency) that we use most often and tune 1:1 for that. For example, I have my FM mobile tuned 1:1 for the local repeaters that I use most often as they are very close in frequency. Good luck.

Agreed... A tuner is the only real way to flatten the match across a whole band.

The A99 is infamous for splatter problems. Neighbors don't appreciate listening to radio ops over the TV, and the ground plane kit on the A99 won't really help that much, and may in fact, hurt ya. So the A99 is definitely out.

You might want to consider a wire antenna set up in an inverted vee configuration. It will still radiate in an omni-directional pattern, and is quite easy to tune for all (bands / channels) and can be used on both AM and SSB. A G5RV with a length of 102 feet, will give you a very good general purpose antenna that is easy to maintain, yet gets out at lower heights (under 50 feet)

For more info, just shoot me an e-mail.

Arnie -

>your 5 watts does no good if someone is out there with more
>

Dead wrong. This is only 'true' if you are strictly observing local, same-channel communications, and even then it is not a certainty. As for DX, 4 watts (12 PEP) on .385 LSB is not any less hearable to a distant station simply because someone else has a higher-powered radio. With skip it's about conditions, antennas, and audio clarity, and no amount of power is going to help you if those factors are lacking or simply aren't there. With local chatter, someone 'waxing your ass' only means you move to another frequency to avoid the noise maker, which is as simple as turning a knob or pressing a button. Besides that, if one is only talking locally, why even bother with extra power? Is an antenna system that poor, or a radio that far out of alignment?
To each their own, of course, but it's a lame attitude that says to get as much power as you can, in order to be assured of contacts... and that attitude is a massive contributor to the amount of noise and nonsense on the CB band.
Linus

Which invention, Thomas Edison had hundreds. Even it was true, which i have no doubt that it is not, he was still taught by whites about white technology of the day. What about the other millions and millions of patents the white race has, that the black race does not. How are you going to explain that without liying. Caucasians win the Patented & Perfected ideas race. The smartest people in the world have always been white. Your higher class black people admit this, behind closed doors. Sorry chumps, but this is not really debatable, except for the mutts playing games.

The caucasian race is absolutely superior, anyone trying to debate this is a politicly correct deluded moron living in head in the sand total ignorance.

So your going to actually say that Africa is as advanced as England, or Germany, or Sweeden or the United States or any other non African nation for that matter. Really! Not quite! The most convoluted brain known to man is the brain of English scientist Darwin. The brains of idiots are smooth. Decades of scientific studies have proven that black peoples brains are the least convoluted of all races, and also smaller. Then why are their heads as large as white peoples you ask? Skull thickness. Smaller brains with a thicker skull add up to a normal sized head with a lower I.Q. To find less convoluted brains than black peoples, you would have to look at the brains of people who suffer from Downs Syndrom. Some blacks do better, but in general they the least capable brain wise in the world. Dig past your politicly correct eminence front and take a look around you to confirm this. The caucasian race created all that is of any consequence in this world.

Who can Africans blame for their lack of Scientific & Technical advancements? The answer is their genetics. Any whites that have, or currently occupy any parts of Africa have helped the Africans with their science & technology and economy.

Case in point, the only part of Africa with any real Science & Technology and a non handout economy is South Africa. Why is South Africa so much more advanced than the rest of Africa by far? White people thats why. Thats why the blacks in South Africa have much better technology and everything else that is advanced in their society. The rest of Africa can't even feed their children. Why do Africans continue to have children they know they cannot ever feed and so will starve to death? Ever heard of morals & foresight?

The only race that comes close to the white race is the Asian race, and they are behind by quite aways. Once they learn how to innovate from nothing more, instead of improving on what has come before, they will be

much closer.

If anyone disagrees with the points put forth in my postings, you really need to raise your standards to the point that you can figuire out that what i have said is, no matter how awful it may sound, true. Then maybe you can stop lying to spare peoples feelings. Otherwise known as political correctness.

After all, self esteem built off of lies or hype is the Devil's religion.

I will leave it with you, because i am off the key on this one. Everyone, no matter what color they are, have a happy 4th of july.

I am aware of George Washington Carver and his accomplishments. He was indeed an outstanding person, especialy considering his humble beginnings. But, i would say that most of his accomplishments were born out of practicality working in the fields as a slave, etc.

Crop rotation, peanut hybrids, working with plant obtained oils, etc, are fairly impressive. But again, lets be honest here, they are not on the same plane of evolvement as the great white scientsts acheivements which number in the millions.

He was not a genius working with advanced mathmatics to discover, lets say, X-Rays, or Radio, or how Space & Time are related.

Impressive for what he was, but in the grand scheme of things, a total light weight. Its always that way for the poor black race, they just don't have much to go on. No Steven J. Hawking.

oh really , you are off the key . after spewing out that nonsense. i
think not. first off , so what is your point? what is your point
really? what is it you want? do you want us to exterminate the black
race? would that make you feel better? you know. hitler wanted to do
that to the jews because he blamed them on all kinds of issues. but you
know. he was wrong. and so are you . the simple fact of the matter is
this. you cannot paint with a broad brush when speaking of these
things. if your theories hold water, and they do not and they will
never , then how do you explain the anomolies that are indigenous in
your so called theories? you cannot. with you it is all or nothing.
and that is where your ideas end. you know, some of the most
intelligent people i have ever met have been black. no sir, you need to

quit wasting time on such silly thoughts and think about how you yourself can get ahead in this wonderful country we called the usa. and get out and vote will you. please. we need all to vote. freedom is expensive and it has been bought with a price. that is what this holiday is about. and you know what. the black people have paid their share of blood and then some for this country even though they have for the most part gotten a raw deal in many ways. this holiday is theirs too. all this talk about race issues is silly. drop it. let lesser minds deal with it. it is their karma. reality, you sir need to look yourself in the mirror and decide how you are going to better yourself, and quit worrying about other folks. and also you need to quit visiting those kkk websites and absorbing all that bs, that they spew out. hatred is a costly endeavor. it consumes a massive amount of energy that could be spent on much more positive things. you sir have a happy fourth and remember this holiday belongs to all americans, dig it,.....cd is out.....

Michael Willey wrote in message
<395E66E9.8A747792@mailhost.det.ameritech.net>...
I am doing a restoration of a 1979 Goldwing and I will be using a radio housing called Cycle sound to house the radio. This comes from the same period that the bike was manufactured. What I am looking for is an AM/FM/CB radio which I can put into the housing. It does not need to have a tape player in it, but would be nice.
Can anyone direct me to any radios that would fit my needs?
Thanx in advance:
M:)

JUNK version of old 70 LTD which was a good CB. I have tuned up the 75 but it is still junk. The ENTIRE CB is in your hand (including coax going down the cord) and cords break @ the head and the ST is a scam! I have 1 70 LTD NOS left.
Dave

> Dead wrong. This is only 'true' if you are strictly observing local,
> same-channel communications, and even then it is not a certainty.

Dead wrong? do you even have the slightest idea of what your talking about?
Lets not even assume cb freqs, there is a pileup on 28.450 myself and 10
stations are calling cq dx to
a "VK" station (he is in australia you moron). The band is open to the
whole east coast so we all are able to talk to him, except
everytime i call him and i am running 100 watts and station xyz in
bumfuct,Pennsylvania keys up with 200 watts
and the vk station never hears me when xyz is keyed up, only when he is off
the key. We both are running 3
element tribanders. I cannot hear xyz and he cannot hear me..but the aussie
hears us both.

As for DX, 4
> watts (12 PEP) on .385 LSB is not any less hearable to a distant station
> simply because someone else has a higher-powered radio.
==========
who cares if it is usb,lsb,am 385,395,or even .555 If you and i live up the
street from eah other and have
comparable antennas your 4 watts will not be heard by anyone, skip or local
talking if i am running more power than
n you. simple facts

>With skip it's about
> conditions, antennas, and audio clarity, and no amount of power is going
to
> help you if those factors are lacking or simply aren't there.
==========
oh no! Then how is it I can lock down the east coast with a mobile while the
other guys are running big base stations
and beam antennas with amplifiers? I'll tell you why because I can outwatt
them... yes they have height yes
they have bigger antennas, but my big big amplifier and mobile antennas put
them on Hold.Why

>With local
> chatter, someone 'waxing your ass' only means you move to another
frequency to
> avoid the noise maker, which is as simple as turning a knob or pressing a
> button.
Besides that, if one is only talking locally, why even bother with
> extra power? Is an antenna system that poor, or a radio that far out of
> alignment?
==========
And your point is?I get no greater pleasure than when a local says were to
close he cant get in between us,
and i procced to cut thier lips off

> To each their own, of course, but it's a lame attitude that says to get as
much
> power as you can, in order to be assured of contacts... and that attitude
is a
> massive contributor to the amount of noise and nonsense on the CB band.
> Linus

Go grab your blanket Linus this is a mans Game....

311. List of the rec.radio newsgroups

Newsgroup: rec.radio.cb
Date: 2000-07-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8joe38$5n9$1@news.hawaii.edu>
Source record: 42341
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
```

I'm not saying that it won't work, I'm saying that it splatters quite badly
and this is not acceptable for an antenna. It may work just fine for you,
but what about your neighbors?

Center fed (over a branch) inverted vee up a minimum of 35 feet, 51 feet each side at about a 45 degree angle. I've had mine up in the same tree for three years, and in another tree two years before that. It's a great compromise antenna that has great bandwidth and is a snap to tune.

How much are you looking to spend? What's your background with CB? A radio with SSB should be a good choice (base - Uniden Washington, Texas Ranger 696F-SSB (better) or mobile Uniden Grant); a 5/8 vertical base antenna (I-MAX, Big Stick, Maco)would be next. From what I've heard, amps are OK, but you don't necessarily need one to get started. Take a look at Bill's Two Way or Copper Electronics web sites; they have all sorts of stuff.

Ask him about his audio equipment. About a $3000.00 radio, about the same
in mixers, equalizers, etc, and a $29.95 mic. Real economy minded.

351. 'nother Newbie Antenna Question!

Newsgroup: rec.radio.cb
Date: 2000-07-03 00:00:00 UTC
From: CoyoteBoy <j.buckle@btinternet.com>
Message-ID: <8jq3l3$d56$1@plutonium.btinternet.com>
Source record: 42270

I have finally got hold of a SWR meter,and I know how to use it!

Now, I have a mobile antenna which needs attention. In the end of it there is a screw in piece, that the lead connects to. This screw in piece, as with the rest of the antenna parts, seems wierd to me. The outer is connected to the inner. Now I can recieve with it no prob, but fear blowing my CB if I transmit. The wuestion is, is the inner of the antenna supposed to be attached to the outer (expecting answer NO!), and if not - since mine is internally, where do I connect an external earth to, would the car body be OK?

Many thanks in advance!
JB

355. Regarding the post....ELION IS GONE.....

Newsgroup: rec.radio.cb
Date: 2000-07-03 00:00:00 UTC
From: jj475171@aol.com
Message-ID: <20000703093551.04487.00000324@ng-fl1.aol.com>
Source record: 42274

As one of the respondant's to that original post I saw alot of different views, and I would like to say these FINAL words about it...(1)- My parents personally experienced the German Nazis invade their homes, take their food away, rape and beat some of my realatives, and ruin their homes...(2)-My parents also had to hike through 100-180 miles of soldiers fighting, bombs going off around them, nothing to eat for days upon days, and step over countless dead people, all in the effort of trying to reach the border of a country that they could hop a boat to get here. I also have a father-in law that fought in the Korean war, got severely wounded (lost part of his right leg) and when he got home (to the U.S.A.) he had to fight tooth and nail to get the "fair" amount of compensation that was due to him for being wounded "In the line of duty".....So I think I know what im talking about when I have or say an opinion about what is fair and decent about forieners and their conduct here, AND what is fair and decent about this country when it comes to forieners, and our treatment of them. I realize that the day will NEVER come when we ALL agree about everything, BUT I feel that this country is MORE than fair, when it comes to helping other countries, and helping refugees, This country was borderline "RETARDED" in their efforts regarding Elion and his family, in my 40 years of life here (and yes I WAS born here) I have NEVER seen this country help out a native AMERICAN to the extent that they did with this little kid.....NEVER. Their have been MANY instances where the United States conducted themselves in-humainly, ...ask any Vietnam Vet what their experience was when they came home.....what about the injustices committed against the "Kent State" University.....OR.....How bout the TOTAL DENIAL of responsibility for the 3-mile Island residents . This Government is much more responsible for illegal injustices to our OWN PEOPLE than they were with this kid. I admit Id much rather live here than anywhere else.....Ive personally been traveling overseas for most of my life, ive been to ALL the countries in Europe, and the U.S.A. is the best place on earth to live, BUT.....I have to say this one last time.....GIVE ME A BREAK ALREADY ABOUT THIS GODDAMNED CUBAN INJUSTICE GARBAGE !!! Southern Miami is litterally Polluted with refugee Cubans, what other country would have taken all of them in?.....NOBODY THATS WHO. Im willing to bet anyone that when Elion went back home, and after the cubans were done burning the U.S. flag, none of them (Cubans) went down to the Un-Employment office and said "Im not accepting my check because the U.S.A. is a rotten no-good country" OR none of them refused their Federal Assistance Checks because they feel the U.S.A. are a bunch of criminals. Now I know some of you are going to say that the Cubans could'nt do that because their families would starve OR you'll say my views are unrealistic to do.....BUT i will give you a breif example.....7 months ago I saw a 60 minute peice showing how the country of China was slaughtering thousands upon thousands of cats for their fur, My wife and I responded by litterally getting rid of EVERYTHING made in china.....YES.....EVEN MY RADIOS AND SCANNERS that were made there. We refuse to buy anything made in China. SO.....if everybody in the Cuban

community feels a horrible thing was done with elion, DO SOMETHING ABOUT IT.....not burn the flag, not beat the hell out of innocent people, but something constructive. I know ive gotten off the subject a little in some areas of this post, but I feel like I have to explain my view as accurately as possible. This is a subject very dear to me, when people start popping off to me about this little bastard I get sick to my stomach, common sense would tell you if one of your parents die, the other living one takes over, jesus christ, this is just normal, the U.S. pissed away one million eight hundred thousand dollars on this mindless issue. I wish ALL Americans well, and I do beleive that WE CAN make a difference in our lifetime, so fight like hell with WORDS not fists. 73......Frank.

Hello Coyote Boy: It sounds to me like you don't know where the shield
of the coax is supposed to go, and that maybe you don't have the antenna
mountes correctly. Your description is a little hard to follow. So I
will make these suggestions.

The antenna is to be mounted, with its connection, not connecting the
body or chassie of the vehicle. If it is, its installed wrong. There
should be a insulator that insulates the antenna from the body. The
center wire of the coax goes to this antenna connection, and the shield
wire of the coax is connected to the body.

Maybe you can tell us more about your antenna installation. Like what
kind of antenna your using, and how you mounted it.

Jay in the Mojave

I agree completely. By the way, just how much did this little stint cost when all is said and done?? 100 million ?? 200 million ??
I would like to know which country i could float to that will give me a home , take me to Disney world, fly my friends in from my homeland so that im not lonely, fly me back home when its decided that i cant stay, and feed me and buy toys and clothes and....well, you get the picture..
How many homeless Americans starved to death under highway overpasses while this whole Elian shit went on ? How many elderly people died from lack of decent medical caredue to our shrinking health plan while Elian was on Space Mountain ? How many American school children were told that their field trips and sports programs were being reduced or eliminated due to cutbacks in spending or budget defecits while Elian the Alien was being lavished with gifts ??? How many more Americans died by violent crimes due to cutbacks in federal support for local police departments so that Elian could live the life that most honest hard working Americans never will..
I could go on for hours citing examples of this misery, but it is a holiday of celebration, not depression. :)
I think i can sum up what Frank said in one sentence. Cuban refugees, this is America. Love it or leave it !
I know this is hardly the forum for spouting off about this Cuban BS, but Frank makes too many good points to be ignored by this loyal American.
Happy Birthday Lady Liberty! B.Bari

Yes, Hillbilly, there IS a price to be an American. Just tell you customers that they are made where the Cobras use to be made at and have BETTER QUALITY to them for the same or less $$$ and you will BE LOVED more than them because YOU CARE about your customers, right? I once worked at a truckstop where I didn't sell any but they did and I got them to get Uniden in. I later told the owner that by doing that I caused them to get sales even when I wasn't there (I noticed this once) because the INFORMED customer does NOT buy COBRA or any CB's that are made in CHINA. MANY truck drivers know this too! Plus tell them of the added benefit of not supporting Communism! Whether they are liberal or conservative this will appeal to them! Then BLOW UP your old supply of new 29's with fireworks tomorrow on the 4th!!!!!!!! (before China NUKES your mountain town) !!!!!!!
Dave!!!!!!!!!!

hillbilly wrote in message <00d1c88c.a5f4832f@usw-ex0104-031.remarq.com>...
cobra is the best selling cb on the market.....sure its made in

Hi, I am doing research on a book, and need some help in this particular area. I was hoping some of you CB buffs out there could help me. I need to locate some data on how or if cb radio sales increased in the 70's. I also am looking to find out if cb radios were of a great importance and played an important role in the emergency medical field in the 1970's? It is known cb's were set up to relay fire/emergency information to volunteer people, I am looking for any information you might have on that? Were cb's used as the early communications with hospitals back then? If you don't want to clutter up your message board with responses you can email me privately at janb@spiritusa.net Thank you in advance for any help you can give me.

Magnum Delta Force Updates and Modifications
Export Frequency Modification Instructions: (25.165 - 29.000 Mhz.)
1. Power up the radio for a minimum of 10 seconds.
2. Turn off and remove power and antenna.
3. Remove covers.
4. Add a 47K resistor to R509 pads. (NOTE: Not necessary on newer units)
5. Remove frequency control knob on the front panel.
6. Remove diode D555 located directly above frequency control switch.
7. Reset the CPU by shorting the two pads as shown.
8. Assemble the radio.
9. Use the (CALL) button to select bands.
To switch between channel and frequency display, press (FUNC) and press (CALL).

VARIABLE RESISTOR INFORMATION
Variable Resistor Adjustment
RV-101 AM "S" Meter
RV-102 SSB "S" Meter
RV-103 SSB Squelch
RV-104 AM Squelch
RV-106 FM Deviation
RV-107 SSB Carrier Balance
RV-108 Transmit Frequency Adjustment
RV-109 FM Repeater Tone
RV-111 RF Meter
RV-112 Q169 Final Bias Control
RV-113 Q168 Final Bias Control
RV-114 Driver Bias Control
RV-116 SSB ALC
RV-117 AM Carrier Low Power Adjustment
RV-118 AM Carrier high Power Adjustment
RV-119 AM AMC
RV-120 CW Side Tone
AM CARRIER POWER OUTPUT ADJUSTMENTS
Follow the steps below to reset or adjust the Delta Force AM carrier power output levels.

1. Remove the bottom or speaker cabinet.
2. Connect the radio to a reliable and calibrated wattmeter.
3. Rotate the front panel power control full clockwise (maximum power output setting).
4. To set maximum AM carrier level, adjust RV-118 to desired level. DO NOT' ADJUST CARRIER LEVEL OVER 10 WATTS.
5. Rotate the front panel power control full counter-clockwise (minimum power output setting).

6. To set minimum AM carrier level, adjust RV-117 to desired level.
LOWERING AM CARRIER POWER LEVEL
The stock DeltaForce has the AM carrier power level set at 4 watts minimum and 10 watts maximum. Follow the steps below to set the AM carrier power level to 1 watt minimum and 10 watts maximum.

1. Turn off the radio and disconnect from power source.
2. Remove the bottom, or speaker cabinet.
3. Locate 470 ohm resistor on the power/calibrate front panel control potentiometer.
4. Add a 220 ohm resistor across the 470 ohm resistor (solder the legs of the 220
ohm resistor to the legs of the 470 ohm resistor).
5. Reset AM carrier power output for 10 watts maximum.
See AM CARRIER POWER OUTPUT ADJUSTMENTS instruction.
DISABLING THE ALC FOR INCREASED MODULATION
Many radio operators prefer to remove the modulation-limiting transistor from their radio to increase the modulation. Follow the steps below to do this modification. NOTE: As with any radio, removing the modulation-limiting transistor in the Delta Force will increase distortion and is not recommended by the manufacturer.

1. Turn off the radio and disconnect from power source.
2. Remove the cabinets.
3. Locate and remove the Q142 transistor. This is the modulation-limiting transistor.
UNLOCKING THE CLARIFIER
Out of the box the Delta Force clarifier control tracks only receive. Follow the steps Below to have the clarifier track on both the receive and transmit.

1. Turn off radio and disconnect from power source.
2. Remove both top and bottom cabinets.
3. Locate and unsolder the diode at D176.
4. Locate and unsolder the resistor at 8244. Save this resistor for a later step.
5. Locate and unsolder the resistor at 8306. Replace 8306 with a jumper wire.
6. Locate the variable resistor at RV-108. Find the leg of RV108 that is closest to the 8244 resistor location and cut it from the circuit board.
7. Position the radio with the face towards you and the solder side of the main circuit board up.
8. Locate the 8244 circuit board pad that is closest to the front of radio. Follow this trace to the pin on the white edge connector. Take the removed resistor from 8244 (step 3) and solder one leg of the resistor to this pin. Count over 2 pins to the right (this pin should be 8 volts DC) and solder the other leg of the resistor to this +8 volt pin.
9. Turn the radio over and locate the gray wire on the clarifier front panel control potentiometer. Follow the gray wire to the 12-pin

connector and cut the gray wire by this connector.
10. Solder the gray wire to the junction of RV108 and D176. Use the hole at the junction where D176 was removed.
11. Put the front panel clarifier control in the 12 o'clock (center) position and adjust RV108 for center frequency.
IMPROVED AGC AND SELECTIVITY MODIFICATION
These modifications for the Delta Force address the following issues: Receiver overloading by strong signals Fluttering or sputtering during reception of multiple AM signals just above "S-9" signal strength Increases SSB IFAGC action to keep SSB "S" meter readings in calibration with AM "S" meter readings at 30dB Smoothes out the SSB AGC Corrects channel bleed-over problems Follow the steps below to correct the above issues:

1. Turn off the radio and disconnect from power source.
2. Remove the cabinets.
3. Locate and remove the 2.21K ohm resistor at 8188. Install (replace with) a 510 ohm resistor.
4. Locate and remove the 10uF electrolytic capacitor at C161. Install (replace with) a 33uF electrolytic capacitor.
5. On the solder side of the circuit board, locate the junction of L107 and Q124, and solder the band side of a 1N4148 diode to this junction. Locate the junction of L107 and 8196, and solder the other side of the 1N4148 diode to this junction.
6. Locate and remove the 2.2K ohm resistor at 8218. Install (replace with) a 1.2K ohm resistor.
7. Locate and remove the 100K ohm resistor at 8147. Install (replace with) a 47K ohm resistor.
8. On the solder side of' the circuit board, locate the junction of 8161, 8159, D111 and C139, and solder the band side of a 1N4148 diode to this junction. Locate the junction of 8162 and C138, and solder the other side of the 1N4148 diode to this junction.
NOTE: if the Delta Force radio is going to be used exclusively on AM and FM modes and not SSB, only steps 3, 4 and 5 are necessary. Steps 6, 7 and 8 enhance the receive on SSB.
MICROPHONE AUDIO LEVEL ADJUSTMENTS
Delta Force radios with the single echo / talkback board also feature an electret microphone. The electret microphone features an audio level adjustment control. To adjust the microphone's audio level follow the steps below:

1. Disassemble the microphone by removing the 2 screws on the back of the microphone.
2. Located on the circuit board inside the microphone is a control potentiometer. This is the electret microphone's audio level control.
3. Using a small jeweler's screwdriver, carefully rotate the potentiometer to the desired audio level. Magnum Delta Force Updates and Modifications
ECHO AUDIO DISTORTION
Distorted echo audio may be experienced with a small number of the early Delta Force radios. Only the radios that have the separate echo

and talk back boards connected by a solder strap have the potential for this problem. If you have a Delta Force radio with a single, integrated echo and talk back board, then this potential problem has been taken care of and this instruction can be disregarded. If this echo audio distortion problem is experienced follow the steps below to correct it.

1. Turn off radio and disconnect from power.
2. Remove bottom, or speaker, cabinet.
3. Locate the echo board mounted to the chassis of the radio.
4. On the solder side of the echo board locate the J1 connector. The J1 connector has the audio line coming from the talk back board.
5. Locate the gray coax line going to J1. If the shield from this gray coax line is connected to J1 then cut it at the board and insulate it to protect against possible shorts.
6. Removing of' this shield and insulating it should correct any' echo audio distortion.

ECHO BOARD ADJUSTMENTS

Located on the echo board in the Delta Force radios are some additional controls. Early Delta Force models featured a separate echo and talk back board connected together by a solder strap. All other Delta Force radios feature a single integrated echo and talk back board. Determine which type of Delta Force you have and follow the steps below to make ad adjustments. Early Delta Force Models Separate Echo and Talk Back Board Fine-Tuning for Desired Echo Sound A secondary echo volume control potentiometer is located on echo board. This control can be considered a "coarse" echo volume adjustment. Follow the steps below to achieve the desired echo sound.

1. Remove the bottom, or speaker, cabinet.
2. Locate the SVR2 potentiometer on the solder side of the echo board. Adjust this SVR2 to obtain the desired echo range.
3. To set for maximum echo effect do the following:

a) Turn the front panel echo volume control full clockwise and the front panel echo delay control full counter-clockwise.
b) Locate the microphone input jack on the side of the radio. Temporarily jumper pin 3 to pin 5 on the microphone jack.
c) Connect the radio to power and a dummy load or antenna, and turn on the radio.
d) Adjust SVR2, until a slight feedback sound is achieved. The echo board will now be set a maximum effect
e) Turn off the radio and remove the jumper from the microphone jack.
f) Turn on the radio and rotate the front panel echo delay control full clockwise and test for desired echo.

AUDIO OUTPUT LEVEL ADJUSTMENTS

An audio output level potentiometer is located on the echo board. If a low output microphone, such as an RK-56 or an Astatic 636L, is used with the Delta Force it may be necessary to adjust the audio output level potentiometer. Follow the steps below

1. Remove the bottom, or speaker, cabinet.
2. Remove the 2 screws holding the echo board to the chassis. NOTE: The 2 screws are different; the sheet metal screw used in the hole closest

to the front of the radio and the machine screw is used in the hole closest to the rear of the radio.
3. Carefully turn the echo board over and locate the SVR1 potentiometer. This is the audio output level control.
4. Adjust SVR1 to the desired output level for the microphone used.
Current Delta Force Models Single Echo and Talk Back Board
Fine-Tuning for Desired Echo Sound
A secondary echo volume control potentiometer is located on echo board. This control can be considered a "coarse" echo volume adjustment. Follow the steps below to achieve the desired echo sound.

1. Remove the bottom, or speaker, cabinet.
2. Position the radio with the front panel facing towards you and the component side of the circuit board up.
3.Located in the left hand corner (closest to the front face of the radio) of the echo/talk back board is an access hole for the SVR1 potentiometer. Using a small jeweler's screwdriver, adjust SVR1 for the desired echo sound.
4. To set for maximum echo effect do the following:
g) Turn the front panel echo volume control full clockwise and the front panel echo delay control full counter-clockwise.
h) Locate the microphone input jack on the side of the radio. Temporarily jumper pin 3 to pin 5 on the microphone jack.
i) Connect the radio to power and a dummy load or antenna, and turn on the radio.
j) Adjust SVR1, until a slight feedback sound is achieved. The echo board will now be set a maximum effect
k) Turn off the radio and remove the jumper from the microphone jack.
l) Turn on the radio and rotate the front panel echo delay control full clockwise and test for desired echo.
Audio Output Level Adjustments
An audio output level potentiometer is located on the echo board. If a low output microphone, such as an RK-56 or an Astatic 636L, is used with the Delta Force it may be necessary to adjust the audio output level potentiometer. Follow the steps below to adjust the audio output level potentiometer.

1. Remove the bottom or speaker, cabinet.
2. Position the radio with the front panel facing towards you and the component side of the circuit board up.
3. On the echo/talk back board, located between the 2 mounting screws is an access hole for the SVR2 audio output level potentiometer.
4. Using a small jeweler's screwdriver, adjust SVR2 to the desired output level for the microphone used.

One of my radials does the same thing, overlapping my neighbor's roof by about 2 feet. Do you get along with your neighbor? Here is what I did. The day I put it up I also gave my neighbor a filter for their TV explaining what I was doing and that my "big ugly antenna" may or may not cause some interference. Of course it does, but only on a cheap phone located in a room directly below my radial. No problems since. Good luck!

Like he said....conditions. The 200 watts from a station in Pa. getting over you has virtually nothing to do with you not being heard from your station, which by the way you did not disclose the locale of in your first example. Many times I have talked to Down Under running the minimum and other stations were splattering the spectrum with kilowatts and the Aussie would hear me. The reverse is true as well. Location and conditions, my friend. Given your last comparison, identical stations, antennas, watts, and living on the same street, what you claim would usualy hold true.
As far as why can you "lock down the entire east coast" from your mobile when big bases are on the air with amps.......very simple, you can't.

Yep you bet, it can go anywhere on the cb band! The radio is a great talker! Dave/Debbie has a very biased opinion, he lets personal views enter his judgement! I personally own 2 Deltaforces, have sold 30+ of them No problems! The company is great to deal with! Thr radios only fault is it has a noisy recieve, some folks say its just oversensitive.......

.....Killrwat,
How would you rate the following three radios as being sensitive?
Grant XL
Connex 4800DXL
Cobra 29LTD

I personally think the Grant has the quietest recieve, the cobra 29 next and the Connex 4800 the noisiest, but also the most sensitive as far as hearing distant stations.

Subject: FRAUD ALERT Chocalatejay@webtv.net;Myron Breland
From: amp357@aol.com (AMP357)
Date: July/02/2000 1:30 PM Eastern Daylight Time
Message-id: <20000702133043.26476.00000107@ng-fy1.aol.com>

I sent Myron Breland, 600 Woodchase, Apt 90, Houston, TX a Postal Money order for $95.00 on May 23 for a Diamond SX-1000 meter, new in the box. Supposedly it was his grandfathers equipment. He has advertised on this site & monitors it frequently. He says he never received the Postal Money Order. I had the Post Office start a fraud investigation & they say he signed the money order on June1. I emailed him this info & the following excuses have been emailed back to me since June 1: 1) I sent you the meter; 2) I sent you back your money; 2) My cousin is sending you the meter from Arizona; 3) MY PARENTS ARE CRACK ADDICTS; 4)my father sent you the money: 5)my father is going to get you. DO NOT deal with this little illterate juvenile delinquent. It's not worth it. If you have been burned start a Post Office Investigation so we can put this guy out of business ASAP. I'm giving him one more week to return my money & I will apologize; otherwise I will make sure that MYRON BRELAND FRAUD ALERT is as well known as "www" throughout the entire internet. BTW Myron you can't sue for slander if it's the truth!!!!

All of my DC boxes are built by Dave, I won't buy one if he doesn't build it. The only other guy at his shop that I would take a box from was 123 and he jumped ship! and I wouldn't own a cheap version of the real thing! I wouldn't buy my wife a cubic zircon either, nor would I want a blow-up doll. It's funny how everything is compared to, and judged by a Dave Made. I guess he sets the standards for quality.
I read a lot of posts and it seems there are some pretty smart guys out there, but for the rest of you bean heads, good luck on 19, and the rest of you should just get a room and finish making love to one another!
Peewee

I have a Maco "Comet", 3 element beam.... new, in the box...., with a Hy-Gain CD45II rotor. I will be mounting it very soon on a Rohn 50' telescoping mast pipe ..(very well reinforced)...along side of my house, bracketed at the highest point.

Problem is, My neighbor's fence is approximately 8 feet from my mast pipe. Would it be legal to have my beam swing over his property line 4 feet, if it is 45 feet in the air?? It won't be over his house or anything, but I was wondering if there is any way I can get around arguing this out with him.......Thanks in advance.......

Maniac "373"

If you guys are so worried about buying foreign made radios, get out there, gather capital, and build your own in Iowa or wherever you care to. Just be aware that at US minimum wages, that $80 radio will retail for $1099, but it will be made in the USA.

funny i have made trips to try and talk to you guys and havn't heard a thing , tryed for gunsmoke and proffessor round lombard . on 19 & 24

if you guys are out there you ain't talking far with your radios

and i would love to se a one pill beat a 2x4 pill unless you have like 1000% modulation i don't see how you could , and if you do have 1000% modulation you would be unable to be understood

An antenna that measures 7/8 of a wavelength does not have a performance advantage over a 5/8 wave. 5/8 antennas aren't made because it sounds like a cool fraction, it happens to be the length that gives you optimum performance. If you boost it to 7/8 you end up with a radiation pattern that rises and actually degrades your signal strength at the horizon - where you want it.

Have a nice day!
MC

No, the tuner "fools" the radio into thinking that it has a 1:1 SWR. But, because of this, the radio will radiate 80% or better of it's power to the antenna, and that's the goal anyway. You may never be able to achieve a real SWR of 1:1 so, use of a tuner is the next best thing, and may some day be the difference between your radio "folding" back on you or transmitting power to the antenna. To be honest, even though I have a built in antenna tuner in my radio (a Kenwood TS 440) I still use a manual tuner (MFJ 949E) because I can tune it absolutely flat almost anywhere on the bands.

Its good they got rid of GOD in the skools. There are so many different religions in America right now that it would be wrong to force Christianity onto non-Christians. And the Bill of RIghts is part of the reason GOD isn't in skools. Freedom of Religion. Forcing Christianity onto non-Christians or people who don't give a shit is a violation of this right. Thats all we need is a bunch of evangalists runnin' around trying to sell religion. And one more thing...We aren't in any danger of Communism taking over or anything so drop the stupid ass Commie bullshit. The only Commie I see here is you.

Ridiculous. Calls me a moron, and claims I don't know what I'm talking about.
Calm down, junior, you're getting your panties in a bunch over nothing.
As far as CB being "a man's game" and all that hepped-up testosterone crap, save it. You can run your big loud radio all you want, I never said otherwise. All I said was low power is far more beneficial to a clean band, and the idea of more power equaling a better radio station is horseshit. Which it is. You're not going to change anyone's mind, and I know those of us who like to run lower power are fighting an extreme uphill battle against the great unwashed who think 'lin-yers' and all that big 'modge' comprise "a man's" station. If attitudes and ridicule such as yours comprise 'manhood', then I'm not missing anything.
Think what you will, act accordingly.
Linus, blanket in hand.

>what is this capacitor shit?
>

no logic to you? how can i explain. you say what y want but blutarsky says the truht. before there is too much noise all skip and bleed. all i know is when the capactor goes in line of the antena now there is no skip and all is quiet no bleed watsoever and i do copy the local so much better. also low swr. blutarsky cvould show you techncal but the diagam is too complex fro you to understand without engneering knowldge. it is a cxapactor made from common houselhold maternial bedman can show if he is choose to and all radio amators know this in other coubtries.

On the early versions, all you have to do to get the Extra channels is Hold the function and call button at the same time. Now you will have the extra channels. Use the call button to change the bands.

In some cities if a tree is hanging over your property you have the right to cut or trim any parts hanging over on your property. The same might apply in this case. I know it's not a tree but I am sure the person's property is large enough to place the antenna somewhere else. It doesn't take much to start a war. Maybe the neighbor will not mind if the issue is discussed before hand.

I think this would fall into a legal interpretation, KP. After all, if an insurer were to say, for instance, the object in question were to fall for any reason, and a reasonable conclusion exists that said object would fall on the neighbor's property, then the neighbor legally may be able to prevent that location from being utilized. I know of a situation where a fella had to take out extra insurance before erecting his tower, the reasoning was the same, on the presumption that IF it should fall, the possibility of damage to another's property exists, and it was not even the neighbor in this instance who was complaining, but the homowners association.

Hello Doc: Yeah your right about splatter, as in the signal splattering. But they mean the A99 antenna, splatters or has more interference problems that the ground plane antennas such as the Penetrator 500, Sigma 5/8, MaCo V5/8, Hustler Antler, Mastodon 5000, or Mastodon Interceptor 20,000.

The A99 antennas seems to have a good low angle of radiation, and a bad angle of radiation that is lower than the horizon, that causes more interference to neighbors electronics.

I wish I had a dime every time I have heard some say the reduced or eliminated neighbor interference problems with a ground plane antenna, replacing a A99 antenna.

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station.

This will probably get me in as much hot water as it did Jimmy the Greek
but the fact is that only the strongest/fastest/toughest slaves were allowed to
have children in order to breed better workers this is why modern
African-Americans are so gifted athletically..Genetics...Most blacks from
African countries are actually not that gifted as athletes.

I hope I did`nt brain my damage.

You would not believe how many ball mounts I have seen installed with no insulator and the big nut holding the center connector directly to the car body. If this or something similar is what you have done do not fill too bad, its been done before. A little more info would help in getting a handle on what you have done, you are pretty vague..

Hello Maniac 9188: Sounds like you got some pretty good advice from the other guys here.

I had a two element quad antenna, that just bearly crossed over the neighbors property. I was only 15 years old then, and my Dad explained to the neighbor that it was school project. But the neighbor complained to the Safety and Health Dept., and or Zoning Dept., and I was forced to take down my great two element Quad Antenna. The neighbor was a real chrome plated, first class, Ass Hole. He hated everyone. Many years before My Grandfather had words with him.

But to make things right, as far as I was concerned as a 15 year old boy, I jammed his AM Radio with my other school project. A old Graymark Model 505 AM Transmitter, that used two 50C5, and a 12AX7 tubes. I wound a special oscillator coil just for his frequency on the AM Radio. I rebroadcast Rock & Roll music from my FM receiver. Of course a few burps and other great sounds a 15 year old would cherish, was thrown in for free. I felt much better knowing that the old Fart was taking it in the ass on his radio, as I did on my antenna.

Jay in the Mojave

Oh Dave!!!! Or is it Debbie, who knows.....
You had better strip, go naked, live in a grass hut,
kill your food, cook it over an open fire, have no
medical care, Hell not even read the bible.....
Because practically everything you use, read, sleep,
get care for in one way or another has some form
of a component from a communist, or former one.

GET A LIFE YOU HOLY ROLLER!!!

WWJD

Source record: 42442

Yea, I agree. Nothing good can come from them. The only thing worse than buying in area that has one is when you have lived in an area for years with no problems and some perpetually bored and nosey folks form a committee to try and form an association where noe had been before. Over the years I have went from originally being zoned agriculture to the present day of residential status. I was fortunate for some years to fend off the inevitable and now I find myself living in a deed restricted area that once was orange groves and palmetto scrub. Each year a new set of proposals is given to be voted on. Now we can only have one RV(be it boat, motorhome, jet-ski, etc.) on locale and no commercial vehicles. Nothing about antennas as of yet, and I have been there at the meetings from the start and am quite vocal and well known for speaking out. I am quite certain the day may come when the antenna issue is addressed and it is a damn shame. When that day does come, I may join the rank and file of huge doses of RF emanating from a dipole in the attic just so I can say, "How do you like me now?"

Well, for one, conditions could be stronger in Pa. than where you are. It is usually the norm that one area of the country has stronger DX conditions than another being heard, not the exception. If conditions are fair in Pa. to down under but are EXCELLENT from your QTH to down under, it does not matter if he runs 100 watts or 1000 watts. I know we all like to think we can create our own conditions, (and damned if I didn't think I did a few times) but in reality it does not jive.

The tunner does not "fool" anything. It converts the output impedance of the transmitter so that it matches the impedance of the antenna/feedline system. It does nothing to change SWR since this is determined solely by impedance of the feedline and the load which has very little to do with how much power is getting to the antenna. The impedance match has everything to do with how much power is getting to the antenna. Tunners can be very good at doing this. They can also introduce more loss than the impedance mismatch that it is correcting. Depeding on your antenna/ feedline combination you can have a very high SWR but a perfect impedance match between the radio and antenna feedline and get nearly all of your power to the antenna. You can also have a nearly perfect SWR and a lousy impedance match between transmitter and the antenna/feedline and get very little power to the antenna.Hopefully we can get things set up where you have both a low SWR as this does have its advantages, and a proper impedance match seen at the transmitter.

475. FS: Assorted Radio Equipment

Newsgroup: rec.radio.cb
Date: 2000-07-03 00:00:00 UTC
From: John <mrbreezej@netscape.net>
Message-ID: <39611161.79D77148@netscape.net>
Source record: 42455

Hello all, I am selling all of my radio and test equipment. Here is
the list:

I think I am getting out of radio, for good. So I have quite a bit of
equipment to sell and I thought that I would give you an opportunity to
purchase before it goes to someone on the internet. Here is the list:

1. One RCI 2970 10-12 Meter radio; 50W AM/FM/CW 100W SSB
$250
2. One Texas Star 1200 amplifier AM and
SSB $300
3. One EC 2018 Road Noise Turbo
microphone Included with radio
4. One Workman 2K Low Pass
filter $15
5. One 24VDC 1.5F
capacitor
$75
6. Two Radio Shack external
speakers $5 ea

7. One Super Penetrator mobile
antenna $20
8. One 6"
spring
Included with antenna
9. One 3 pad magnetic mount with 14' of RG8U 95%
shielded $15
10. One DAIWA Cross-Needle power/SWR meter 2KW max range
$100
11. One Radio Shack 3A power
supply $20
12. One Radio Shack Frequency
counter $20
13. One 300 W MFJ 260C dummy
load $20
14. One 1.5KW MFJ 264 dummy
load $40
15. One 60A DAIWA power
supply
$150
16. Assorted electronic parts in storage drawer
cabinet $15

All equipment is like new, REALLY. I take care of my equipment. The radio and the amp are 6 months old.

If you responded to an earlier for-sale note a few months back, I lost the messages, computer problems. I am back on line now and want to sell everything. I will consider reasonable offers. Email a response if interested. All prices exclude shipping charges. Buyer pays shipping and cash only sales. I am in the Washington DC area if interested in seeing before buying.

John

P.S. I also have a 100MHz O'scop that sometimes works and sometimes doesn't. It is a Textronix with all manuals. Make me an offer if interested.

Scott,

I agree with you, but I was listening around last night and the so-
called "freeband" was busy all the way down to 26.500. You are right,
tho in that you are more likely to get noticed down below channel 1
than above 40. Those are military frequencies, and IF (maybe a big "if")
the USAF, Navy, or Army notices you, there WILL be something done.

BTW, I have never really listened to channel 6 and 38, but last night,
the skip was rollin' and a-roarin'. This is an objective observation,
and nothing should be inferred from it, but I couldn't understand what
was being said on 6. LOUD, but unintelligible. I tried my best to make
out what was said. Nuttin' doin! What have they done to their audio to
make it so garbled?

LOL, sounds like another way of saying the radio didn't do the impressive numbers i would have liked it to, but it works.....

Seriously, good choice, I think you will be happy with the radio, If you want more specifics on the radios performance I would agree with Professor, go back to the source, tell him your curious about how well its doing.... Or buy a wattmeter...

Lets assume that the neighbor has no right to the space over his property and has no legal recourse to make you move the antenna. If I were the neighbor and did not like the antenna I would erect a pole that smacks your antenna everytime you tried to rotate it over my property or purhaps have a yardarm on it that extends over the propertline to further interfere with the rotation of your antenna. It would be just as legal as your antenna. Move the antenna. If you start a war you will lose.

Message-ID: <lw985.4067$f11.25686@news3.atl>
Source record: 42480

That's the point we were making. Signal splatter is well known, and when we run megawatts on AM to get out a few miles, splatter is the result. But a low radiation pattern with an antenna will "splatter" into a neighbors home, just like it does across several channels. Did it bother Doc that we didn't use the technical term of "low angle radiation pattern"? I guess so.

Arnie -
KT4ST

This is old news, this guy, I think. I heard him about 2 weeks ago fading in and out in VA but when he was in there, he sure was in there. It sounds incredibly automatic since the tone, pitch and stress of his voice doesn't change at all. If I were doing it, I would run outta breath real fast from saying that so much. Oh well, someone will find him. He has to be in someone's neck of the woods. If someone does find him, I'll gladly send them a nice long needle from the craft store down the street. Now whatever happened to that guy saying "I got might nightie on, I got my little red panties on and I'm ready to go to bed!" ? That was actually funny although annoying.

Source record: 42490

You size the alternator to carry all of the load if you want your voltage to stay steady when you transmit, if you undersize the alternator you will pull down to battery volts and put to much load on the alternator. If the alternator is properly sized you will see very little load on the battery, believe it or not this is the proper way to do it. If the alternator is to small you will put what it is rated at and the additional current requirements will come from the batteries, this will wear an alternator out.

>

Thats a REALLY BIG IF..... Below 26.965 has been mainly AM and
in use for as long as I remember, I really think if the Military or anyone
else wished to lay claim they would have done so long ago..... I'm sure
the Military is Well aware of the encroachment, I do agree if they cared to
have it enforced they would not be as impotent as the FCC.... I think
thats kind of the point, if they wanted to they would have.....

> BTW, I have never really listened to channel 6 and 38, but last night,
> the skip was rollin' and a-roarin'. This is an objective observation,

527. SWR on base station

Newsgroup: rec.radio.cb
Date: 2000-07-03 00:00:00 UTC
From: "David P." <L65diesel@ev1.net>
Message-ID: <sm2qb2b4op358@corp.supernews.com>
Source record: 42557

If a person were to have a 1.5 SWR on dead key, but when modulates the SWR swings past 3, what could be the problem?

This is with or without a amp inline. When a small amp is put inline and turned on, the SWR keys at 2.0 and swings back to 1.5.

The antenna is a ABS-1600 at 17 feet, and can't be raised any higher at the current location.

I've helped several CB'r friends of mine by doing the same thing.... either form a choke of coax at the base of the antenna or add ferrites. A-99's (and most other verticals) do a poor job of decoupling the coax from the radiating element (some moreso than others), resulting in the coax being a part of the radiating antenna system. A 6" diameter coil of 8 turns of coax at the base of your antenna will do the job in many cases.

> -=PEAKABOO=-

.......Keep in mind that an Alternator rated for 100 amps is rated on a duty
cycle basis... OEM 100 amp alternators won't last long if you ask for 100
amps for very long. (...ever notice that a stock 100 amp alternator has
only #8 AWG wire on the output terminal?)

>I for one am getting really sick of hearing about Dave&Debbie's
>"anti-commie" obsession

His methods may be a little crude, but he is on the right track. We as a whole, includeing myself, tend to worry more about our own personal comfort and convenience than doing the right thing. If he seems to be persistent "obsessed" it's may be because no one is listening. I think if you got to know him, and I don't, you may find that he is a decent, honest, God fearing man. I beleave that we need guys like him to remind us what we are, or aren't.
Keep it up Dave!!!

these are good solid little radios that have been proven over time. there similar to the old grants. 119 is a little high for that radio so shop around on the net. some will try to talk you out of buying it because it doesnt have a echo or roger beep and all that trash but it is a nice radio that talks well and has a pretty good receiver.

>found one at Bob's CB for $119.99. Is this a good buy and a good CB.

> By the way, just how much did this little stint cost
>when all is said and done?? 100 million ?? 200 million ??

By the way this little stint should have cost us nothing. No press, no attention, no issue. The boy should still be home here in America thinking about going to school this fall. And just for your info. Those of you who thought this was all about a perents right. The boy has already been taken from dad, and it's expected that he will never be raised by dad. You and I have been given freedom by our forefathers and those who have fought to protect our freedom. Yet you would deny this little boy the the same that has been given to you. We are a self centered nation with out honor. Kind of like a spoiled child who has been given a toy, and won't share. NO!! IT"S MINE MINE MINE, AND I WON"T LET YOU HAVE IT!!!!!!

> How many homeless Americans starved to death

> How many elderly people died from lack of
>decent medical care

How many did you help out? What did you do to make a difference?
>How many American school children were told that their field
>trips and sports programs were being reduced

Big deal.

>spending or budget defecits

There are none no longer. Wake up!!!!

>How many more Americans died by violent crimes due to cutbacks in
>federal support

Where are you from. More money than ever has been spentm on this type of thing. To much matter of fact. Hello! Wake up!! Any one home!!!

I agree entirely. No matter how big your radio is, if you don't have a
good antenna to carry that power you are fighting a losing cause.
However, you didn't specify if you were looking for a base or mobile.
But, either way a good antenna and then good radio and possibly amp.
Good luck, Rocketman "822" in the wheatfields around Derby, Kansas

Happy 4'th of July DX'ers !
I inherited a Hunter Bandit 2000a a couple years ago. I am not much into fiddling with the old tubeset linears, and would like to sell or trade it..I last had it plugged in a year or so ago, and could get about 800 out of t(not really trying to get it working hard), but i know its gonna need someone who digs these things to give it a little attention.
My friend replaced all the large electrolytic caps before he got bored with it. All the tubes were still working when i fiddled with it last.
I do not want to ship this thing, and am in Connecticut..If there is any interested parties that want to do a swap or buy it, contact me at this group or e-mail me at GMpartsdude@home.com .
P.S. Hey 002 in Georgia, you are waaaay too loud in CT this weekend..That DX99 is booming in !

567. Re: SWR on base station

Do you have an antenna matcher to match the impedance between the radio and antenna? Might be a good idea to get one and do you have a good meter or a cheapy?
If you have a cheap meter it may not be reading right. An SWR of 1.5 isn't all that bad, and like the other said you check the SWR with the deadkey, not with the swing. Good luck!!!

568. Linear Amps and SWR

Newsgroup: rec.radio.cb
Date: 2000-07-04 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <Wkn85.19407$qS3.48500@tor-nn1.netcom.ca>
Source record: 42535

Could somebody tell me why my SWR is higher when my linear AMP is on, compared to when it is turned off ?

My theory is that the AMP is possibly introducing harmonics into the coax, and being as the antenna is not tuned for them they are being reflected and causing a higher SWR.

Would a low pass filter help or would it just be better to purchase an antenna matcher ?

Thanks,

Richard.

Just for your info. Eleon is no longer with his dad. The Cuban goverment has taken the boy to provide for, and school him. It is most likley he will not even be permitted to see his dad for years, and will be raised by strangers. As compelling as your story may be, it has nothing to do with Eleons case. His case had nothing to do with a parents rights.

You are not recalibrating the meter to accomodate the higher power undermodulation when you put it under modulation If your swr is a 1:5 with a deadkey it will be the exact same under audio except your meter will not read it correctly with out recalibrating. The swr ratio is always the same 5 watt deadkey .2 watts reflect power = 1:1.5 swr, the same goes for under audio 10 watts of audio and .4 watts reflect = 1:1.5 swr

Yes.

> My theory is that the AMP is possibly introducing harmonics into the coax,
> and being as the antenna is not tuned for them they are being reflected and
> causing a higher SWR.

That's some of it. The other part is that SWR meters
use diodes. Diodes are non-linear devices, therefore
the accuracy of the instrument changes as the voltage
through it increases. In other words, the reading will
naturally increase to a certain degree when the amp is
on.

> Would a low pass filter help or would it just be better to purchase an
> antenna matcher ?

If the difference is not extreme, I wouldn't worry
about it. In other words, if the SWR with the amp
off is low (1.5:1 or lower as measured at the out-
put of the amp), and the SWR with the amp on is below
say 2.5:1, there's nothing to worry about. An
antenna matcher won't do any good at all since the
antenna is already properly tuned, and a low pass
filter is just a mask--it doesn't make the amp more
stable (instability is the cause of the high harmonic
and parasitic content).

If the difference is extreme (amp off SWR is 1.5 or
lower and amp on SWR is in the red), there are two
possibilities: the antenna is breaking down when
high power is applied, or, the amp is very unstable.
The latter is more likely if the amp produces 500
peak watts or less. The best way to check the
antenna is by substitution. Sub in another amp
that is known to be stable, or an antenna that is
known to be able to handle the power of the amp in
question. If it turns out to be amplifier insta-
bility, you can mask it to a degree with a low-pass
filter, or (a better solution), have a good amp tech
re-optimize the amp for increased stability.

> Thanks,

You're welcome. I hope this helps.

Some like them, I don't. If you want SSB for least dollars, try Uniden Grant (around$140), or Copper Electronics has the Eagle Sidewinder and Superstar 3900 for arount the same price. The later two also give you FM and extra channels.

I think the Cobra 18 is one of the nicest little radios on the market. The case is solid and it has weather too .
There is one listed on the following auction and it ends in 2 days . The price is $40 now at auction. Check it out at:
http://www.baybuilder.com/sites/index.cfm?siteid=4018717952

Good Luck

Probably nothing. The SWR meter is calibrated for the dead key power and not
the higher modulated power.

The A99 causes common mode currents on the coax shield. I am aware of this first hand. The fix was suppose to be the add on ground plane that decoupled the feed line from the antenna. From all I have heard it does not work very well. I tamed mine by putting a ferrite bead BALUN at the feed point. This got me out of the telephones and light dimmers. Splatter never was a problem.

> theory? Thanks....Mark

1- The cooling blades are 'pointed' towards the pulley to
help provide cooling to the pulley/belt.
2- Under less than max load, the alternator carries all the
load, battery supplies none. It isn't a smart thing to do
but after starting the motor, and with no accessories on,
the battery can be disconnected and the car will still run.

604. Re: 'nother Newbie Antenna Question!

Newsgroup: rec.radio.cb
Date: 2000-07-04 00:00:00 UTC
From: CoyoteBoy <j.buckle@btinternet.com>
Message-ID: <8jsc89plg1@plutonium.btinternet.com>
Source record: 42584

Ta guys

Actually, it's a magnetic mount, and what I was trying to say was this:

The inner and outer of the 4ft mobile antenna are connected (not when it is mounted, when I'm holding it in my hand). They appear to be connected internally and so it leads me to believe that they should be like that.However, when I connect up the co-ax to it, i'm gonna have to make sure that the shield does not come into contact with ANY part of the antenna because they are all common. Instead I am going to have to chop the shield off at the point that the inner emerges, insulate it with tape, and connect the other end (somehow, maybe to the neg of the mobile unit itself) to an earth on my car body. Am i right?

This way I have an inner connected to the antenna only, and an outer (shield) connected only to the car body, but still covering 99.9% of the inner leading up to the antenna. This is right?

Any more clarification needed?

Many thanks you guys

JB

1. Get a good antenna system first, penetrator, wilson 5000, etc.
2. Make sure it is installed properly Then get a Uniden Grant XL, Cobra 29LTD,Uniden 76, Connex 3300HPZX or radio that has good modulation.
3. Get a good radio shop to set up the radio and check the antenna system and grounds.
4. Ask the radio shop if he has a decent small amp to help you make the range you need for distant operations.
5.Have fun!

Most of these amps have nothing for harmonic suppresion and it is pretty normal to find the situation you have for both mentioned reasons, harmonics and meter sensitivity. Most amps can also stand some improved output impedance matching. A circuit that will get rid of harmonics to a large degree and improve impedance matching can be made will one coil and one variable capacitor making a simple L network. The ARRL handbook is the source for how -to.

Wrong. He will have no contact with family. haven't you even watch the news latly. As the story goes, he will not see his dad for at least 2 years. He is now goverment property. He will now be groomed to be a communist pawn. This case was not about parents rights. Clinton owed some one, and Eleon was the pay back.

You are seeing that because your amp has a poor match...
That's the problem with every amp I've ever hooked up. That's the main
reason they get so hot.
You could use a matcher to correct this situation. It will help the
reflections problem and keep the amp running cooler as well.

Richard,
The simple answer is that the output impedance of the amplifier
is not 50 ohms. There could be a number of reasons for that, and
not knowing what the amplifier is, I don't have the slightest idea
which one it could be.
'Doc

It's not exactly stock now, it's been fiddled with left right and centre.
The co-xa has snapped out of the connector. The CB itself isa bout 15 years
old! and has seen some use.

bullshit, if you have a meter that is capable of giving you correct reading
this would not happen. Everyone is always quick to blame the amplifier. try
a "Bird" or coaxial dynamics meter with a dual line section take 2 slugs 1
for reading forward power the other for reading reflect power. Turn the amp
off check the swr turn it on and check the swr the ratio will still be the
same.

I have a radio shack SWR meter that can handle up to 2000 watts. I guess it is only usable for measuring power with the amp on, and the SWR with the amp off. By the way, I only have a 100 watt amp.

Richard.

Bill,

With the amp off, Channel 40 SWR is 1.05:1 and Channel 1 is 1.5:1.

With the amp on, Channel 40 SWR is 1.5:1 and channel 1 is 2.2:1.

(I generally hang around 38 LSB, so the above fortunately works out well for me !)

Unfortunately I am at the end of the adjustment range of my K-40, so that is as good as I can get my SWR. I believe that the antenna is not breaking down, as it has a 500 watt rating and the amp I have is only rated at 100 watts. Also, signal reports from other CBers are very good with the amp on. (I would imagine breaking down of the antenna would cause distortion).

My radio shack SWR meter can handle up to 2000 watts, so I guess it may be a case of it only being good for measuring power with the amp on, and SWR with the amp off.

Thanks very much for the information Bill.

Richard.

I may pick one up and try it. They seem to be going fairly cheap at the local CB shops, and even if it doesn't help I may use it in another installation.

Thanks,

Richard.

You ARE recalibrating the meter with the amp on right? if you
calibrate the meter with just the radio and just switch the amp on
without adjusting for the increased forward power then it will throw
the reading off.

not to make you sound like an idiot but just trying to cover all bases
here.

Yes... they cost typically around $25 for a "no frills" unit and work very
well. You should easily be able to reduce your moderately bad match to flat!

It's not a false reading at all.
Depending on which side of the amp you have the SWR meter on... you are
either seeing the amps input or output impedance.

669. President 10 meter radios stolen.

Newsgroup: rec.radio.cb
Date: 2000-07-04 00:00:00 UTC
From: tony@palcoelectronics.com
Message-ID: <0c322411.c8b85aef@usw-ex0101-005.remarq.com>
Source record: 42649

On 7-3-00 three new President 10 meter radios were stolen from a glass show case @ Palco Electronics. They were: George Serial # 98501911, Grant Serial # 99601770 and Lincoln Serial # 99500159. If anyone has any information regarding these stolen radios and the people involved. I would appreciate the information very much.

Thank you,

Tony Palmieri

Brain Damage:
That would be good work since most of them were made AFTER the war and if the numbers that they claim that were killed there were done, then they would still be doing it (not enough time to do it in a few years for the numers they claim killed there). The concentration camps were FACTORIES making ARMS for Germany. The deaths (less than 1 mill.) happened at the end of the war when food was gone & disease took over. Also the smokestacks would have to be high so the locals wouldn't be killed too. Also diesel gas doesn't kill anyone (wrong smoke for this BIG smoke story). I am more interested in communist murderings in Russia, Laos, Cambodia, and where ever the hammer & sickle goes! Also current Holocaust in the Sudan where Black MUSLIMS KILL Black Christians (dey killin' da bros, man!)!!! Not to mention Bill Clinton's murderings too. I speak the truth. Your brain IS damaged from propaganda that is not based on facts! I'd rather go to a CB Memorial Museum that listed people killed because of CB, People Married because of CB, people born because of CB !!!!
ANd Happy July 4th. You ARE an American, right????
Dave!!!!!!

No you are testing the Antennas or loads impedance by having a swr meter
after the amp you cannot tell what the amps impedance is with a swr meter ..

And you are supposed to be a designer of amplifers, it shows you dont have a
clue

Source record: 42666

So now the Holocaust didn't happen? Is that what you are saying? Are
the photos, films, and documents from WWII fake. Are the eyewitnesses
who were THERE telling lies? I think not.

1. If you have ever seen pictures of the chimneys of Auschwitz, Buchen-
wald, Treblinka, they WERE tall.

2. Are you so insulated that you never heard of a gas called Zyklon-B?
Sure, they tried diesel smoke and it didn't work. The Zyklon-B was
in the form of pellets and was poured into "vents" on the roofs of the
"showers". It killed within minutes. Those "factories" as you call
them, ran 24/7, and this didn't count all those who were lined up in
front of a trench they were forced to dig and shot with machine guns,
or just plain worked to death and THEN sent to the gas chambers or shot.
I knew a man that served with Gen Patton and personally saw bodies piled
like cordwood 10-12 feet high. General Patton forced the burghermeister
(mayor)to have the citizens of nearby towns to go thru the camps and
see what they "didn't" know was happening. Many people, including Pat-
ton, became physically ill at the massive carnage. One mayor and his
wife committed suicide. All these events are well documented. Anyone
can deny what they don't WANT to believe. Oh, why would you need a
bunch of furnaces for in an ammo factory?

OK Knight Patrol,

1. If it is I you are speaking of, the agency would be USAF. I didn't assign the frequencies--USAF Frequency Management did. Without trying to be ugly (I think we have been thru this before), certain bands and particular frequencies are picked for good reasons. Those reasons have nothing to do with CB whose main thrust, right or wrong, seems to be hobby, get out as far as you can as much as you can, and the heck with whomever you interfere with. Various frequencies have certain inherent characteristics, i.e. they interact with the atmosphere at various levels in different ways. Understanding how that works is the key to frequency selection by professional military and/or military communicators.

2. A frequency legally assigned to any agency whether it be police, fire, or military has the rights to that frequency no matter how infrequently it is used, and should be able to make use of it as so chosen. No amount of "excuses" will change that fact--it's not a flame, just the truth.

3. The frequencies in the 25-26 MHZ are NOT CB frequencies or "channels".

4. IF I choose to use a frequency legally assigned and for which I am duly authorized, I am not gonna get mad. It isn't worth that. BUT what I will do is file an Interference Report, forward it thru channels, and I guarantee you something will happen. And if you want to go up against the military, that's fine. Hey, I don't care. It's not my wallet! LOL!

And none of this is meant to flame anybody. I am just telling the truth. Like it or not, it's the way it is. Best thing to do is if you are bound and determined to "freeband", do it above 40. Less likely to get noticed that way.

This will not fix the problem with the output shunt on an amp unless there
is not enough capacitance.

Is this the digital meter Radio Shack made? If so it will give you an
accurate reading, amp design can make a meter read a high SWR. This could be
due to the output tuning of the amp. This seams to really show up if the
antenna is reactant.

DBI= db over Isotropic source, which Isotropic source is a theoretical non-gain antenna which radiates evenly in all directions, DBI is a manufacturers way of making it look good on paper... DBD is a much more realistic measurement, it simply means db over Dipole.... A simple wire dipole can exibit over 9 DBI...

If you care to learn more about antenna theory many good books are available!

Hello there,

I have one and have been using it for around 6 weeks now. I am very pleased with the sound, and it gets out very well. I recently had it "peaked" to get even more power out of it, and it runs just perfectly. I can chat to a "local" guy about 40 miles away every morning on the way to work, and I can even get down to Wisconsin, Virginia, Florida etc all in my car using just a K-40 !! (I am up in Ontario).

However, I have heard that the Uniden Grant is a better radio. The filtering etc. is supposed to be better for mobile use etc., but I have not used one myself.

By the way, I got mine for $8 (Canadian) at the local Goodwill, so I doubt you will beat that price !

Let me know if you have any questions.

Richard.

ok , i had a wilson 5000 , and i baught a president penn.

fit right on the wilson mount , which was kool .

here is the impressive part . swr on the wilson was 1.4 on1&40 and 1.3 on 20
. a decent curve

on the president they are a 1.1 on 1& 40 and small bit lower on 20 .

infact the swrs don't go above 1.5 on any of my 6 bands .

i also saw a noticable increase in the recieve , and transmitt
making contacts much more fequent now . local talk is better too.

so thanks for all your opinions .

BTW : it is a +6 dbi gain , which on of you said is much different than a +6
Dbd gain . what is the difference between Dbd and Dbi ?

Hi I am very new to CB Radio and I am learning different things about it everyday now (I have yet to receive a hand held model that I have order, so I am hoping to get a head start).

I am getting a handheld cb (a general electric model). It has 4 watts of output. Also, it is a 40 channel, but what is a "PLL" circut?

Anyway, I was wondering what is the initial range of this radio in "favorable" conditions? What is it 5 miles or less? I know I can revceive transmissions from all over the country. I will mainly be using this out in a relatively flat terrain area sort of "rural suburban" (so less interference from other objects) and on the road. I bought this model because I do not have alot of money for a base and I did not want to get a mobile unit because I want ot walk around with my CB.

And what procedures can I take to improve transmission/reception? Antenna? Mods (I doubt any exist for a hand held from what I have read)? I know it has a BNC coax connection on it which is similar to a Radio Shack sports hand held that a friend let me use once (I know about coax cabling from working with computer networks so I recognize the connections). So is it possible for me to add an antenna, say that you would mount on your car?. Thanks for any help!

> #22 north central illinois mobile

An easy way is to connect the radio through an SWR meter,
to a 50 ohm dummy load. SWR should be 1.1:1 or there-abouts.
Now you know the output of the radio is at or near 50 ohms.
Remove the dummy load, substitute the amplifier, now see what
the SWR is. If the input to the amplifier is at or near 50 ohms
the SWR should be the same as with the dummy load.
'Doc
PS - Only one "i" in impedance.

If your that worried about impedance, use a tuner, or some
other impedance matching system.

i recently got a midland 75-822 cb. it converts from a handheld with a battery pack and shorty antenna to a mobile unit with a cigarette lighter adapter and external antenna connector. as a handheld with a little tiny antenna, it does as well as any handheld would... pretty crappy. it seems pretty good as a mobile, although i don't have experience with any other model. i have a 4 foot antenna on my car for when i'm using it as a mobile. it has some features that other mobiles don't have, while missing some features that others include. i'm no cb guru like some people on here claim to be, but it works pretty good for me. i like it 'cause i can convert it to a handheld whenever i want to be able to talk to other people close range outside my car. take a look at it at amazon.com, just search for "midland cb". that was the best deal on it i found.

hope any of this was helpful

its really hard to maintain a "top dog" radio system when you are changing trucks all the time (slip seating).... everytime you slip into another truck everything has changed. I think doc has the best idea. put a tuner inline and adjust it for best swr each time you change. get good quality quick connects for the power cords and make sure you have a good ground on the antenna. in other words keep the vise grips steel brushed and clean.

Sounds like you really want to get out and communicate with other people, so here is what you need to do:
1. Cancel the order for the handheld radio.
2. Order a mobile-type CB of >>any<< brand. Even the worst mobile CB is better than the best hand held.
3. Put twice as much effort into getting a good antenna as you did researching the radio. It is all in the antenna.
4. Avoid any crap you might have heard here about modifying the radio. Anything you do to it is likely to render it illegal to use and is unlikely to significantly improve the output at the listening end.

remember, all your radio see's is the amp. it don't even know there is an antenna. all it see's is the pills in the amp. if the swr is high in the amp take it to a cb shop and have them work on the input impedance. they can change with a simple cap...

good little radio, #2 from the top of the Uniden line....they
used the same chassis for the Uniden 610 Base. a bit
narrowbanded if you decide to add xtra channels.

You know, the best way to tell if some one hears you on a freq is
to listen to it your self after you transmit and see if anyone comes back to
you.
does your speaker not work in your radio?
is that why your always asking if anyone hears you?
or does no one respond to you on the air just like we dont here?

Nonsense! It has everything to do with it. The input and output matching is critical to the throughput of any RF amp. I tell you what... you take any amp and change the output transformer ratio and recalculate the amps efficiency. What you have done is purposely create a severe mismatch. You will find that the efficiency drops like a rock... and the amp will get hotter than hell! Remeber that the efficiency is directly proportional to output power. When you mismatch... the output power goes down. Therefor the efficiency will drop off. The efficiency is perhaps the best way to see if an amplifier is matched properly.

Good deal, the term "Angle of Radiation" is properly used.

> The 'angle of radiation', or the lowest abgle of radiation refers to
> only one of several nodes in an antenna's radiation pattern. All
> angles of radiation are measured from the horizontal.

Yes I agree with you here so far. And a good point that there are other than the low angle or radiation lobes working, not just as some books show a difference between a 1/4, 1/2, or 5/8 wavelength antennas, on a perfect ground, but most antennas are elevated antennas, that do have a major significant (approx. 45 degree) high angle lobe.

> You don't have any angles of radiation 'below' the horizon/horizontal > that amount to anything.

No I disagree here. When a choke is placed at the or near the feed point of a A99 antenna, it reduces the radiating currents on the outside of the coax, which helps reduce or eliminates, the below the horizon radiated energy. The A99 Antenna and impedance matching system does not properly decouple the energy of the antenna to the coax.

> Although, there is radiation in all directions
> from any antenna, straight up, straight down and every thing in

> any antenna.
> Antenna don't cause 'splatter', radios do.....
> 'Doc

Nope Doc, this ain't right. There is a small difference between CB Base Antennas, in dB as compared to each other, as a measurement in field strength. But a significant difference in interference problems, as compared to all the CB Base Antennas. A lot of CB Base Antennas are made to keep manufacturing costs down. And the heck with performance, since the CB'ers will not be able to tell a significant difference between a good antenna and a poor antenna..... I'll bet was the marking plan in

some manufactures plans. However through time and experience we have learned that some antennas do cause more interference than do others.

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station.

I disagree Doc, They are a fine Radio, I don't care for a 5 minute Ping, just a 1/4 second is good or even none at all, A person cannot go wrong purchasing one, I don't care to sell any of the Brownings i own, However if I did, I can guarantee you I would have no problem selling them, or Getting much more than i paid.... What is there to get "fed up" about?? The Tram 201 is a nicer radio if your going to use SSB and AM, but if your Home is mostly AM you can't buy a nicer reciever or transmiiter.... Yeah fine, my Collins 75A4 and the Johnny 500 are much nicer, but we are talking legal CB Radio........ and for a CB it will run circles around a Cobra,RCI, President, or most other radios on the market..... The only true Flaw is they can be tough to operate on SSB if your not used to running seperate TX/RX, once you get past that...........

tell
> you this. I think if the inductor is in series and the cap is on the
output it
> is a step up network, If the position of the component s are reverse it is

step
> down.
==========
You are correct, inductor in series with cap is a step up transformer as well as being a (2) pole lo-pass filter. as well as cap in series and inductor to output is a 2 pole high pass filter as well as a step up network.

When you put the radio into transmit mode and do not speak you are dead keying the unit. This is the wattage level of your carrier before you modulate.

When you put the radio into transmit mode and speak or introduce sounds into the microphone you are modulating the carrier, causing an increase or ' swing ' in the watts output.

Though it must be understood that most people whistle into the radios microphone to check their swing. This is because a high pitched whistle will modulate or swing a radios carrier more fully than a normal speaking voice.

The problem with checking a radios swing in this manner is that most people do not communicate by whistling...so if you want to check a radios swing as it would be in a ' real world ' everyday situation, then just talk into it as you would normally. So long

And as I said before, amplifier efficiency has nothing to do with
matching input or output impedances. If the input of an amplifier is
50 ohms impedance, and the output is 450 ohms impedance, and if the
amplifier is properly matched to an antenna, it's efficiency will/can
be high. The same for an amplifier with 50 ohm input and output
impedances, if it is properly matched to the antenna. Efficiency is
high in both cases and has no relationship to the input or output
impedance of the amplifier.

An amplifiers efficiency IS affected by a mismatched load. A class
AB amp that may be 60% efficient when run into a 50 ohm matched
load will run only about 30% efficient if run into a mismatched 2:1
load.

Typically a 100 watt amp may draw 14 amps at a 1:1 match.
Take this same amp and run it through a tuner to get a 2:1
match and you will see approximately 28 amps of draw. It
still puts out approximately 100 watts so what has changed?
Its efficiency.

The matcher you need is not fairly cheap, it has to be able to handle the
output power of your amp.

5. Increasing the power output of a handheld will NOT make a noticeable difference
in the receiver, but will kill your batteries faster.

Within the last year there was a good article in QST on how to convert a D104 to work with a modern rig. Even a kit available.

Based on that article I modified the Astatic mic I recently recieved.

My D104 had the TUG8 base containing an amplifier, which I reconfigured for "floating" ground and to be powered by the microphone line. I get great audio reports.

I don't think you'll see any real difference in performance between the
two radios. The grant has more knobs and a 8719 PLL so you can expand it
without a crystal (Expo) kit.

816. New Wilson 1000, Bad SWR!!!

Newsgroup: rec.radio.cb
Date: 2000-07-05 00:00:00 UTC
From: IBM233@webtv.net
Message-ID: <16714-3963636F-5@storefull-218.iap.bryant.webtv.net>
Source record: 42810

I just got my new magnet mount Wilson 1000 in from LCR, (Coax Kid) to replace an aging wind battered K40 and I'm having problems with high SWR. I'm getting really high SWR readings with the Wilson that I never experiencd with the K40. Here are the readings:

Wilson 1000:
26.285 3.0:1
26.755 2.0:1
26.965 1.8:1
27.205 1.5:1
27.405 1.4:1
27.655 1.5:1
27.855 1.6:1
28.105 1.8:1

I then put the K40 back on and rechecked SWR.

K40:
26.285 2.0:1
26.755 1.3:1
26.965 1.2:1
27.205 1.1:1
27.405 1.1:1
27.655 1.5:1
27.855 1.7:1
28.105 2.0:1

Are these normal readings for a Wilson 1000? How can I lower the SWR? My radio setup is an Eagle Sidewinder 400 with the antenna mounted on the center of the roof of a Chevy Corsica LTZ. Thanks

Source record: 42817

Dead key is the power output of the radio without speaking, or making any other extraneous noises in the mike, IE: Burping, Farting, Whistling, ETC... When you either speak or make noises with the mike keyed this modulates the signal which in turn provides your "swing" or modulated power.... Both power measurements vary from radio to radio.... This is a little simplistic, however it does give you a basic answer....

I will be intrested in purchasing a Browning Eagle base radio soon.... Would like to have some more info on them first, Which one has the best of the keyup scream?? I read about one (I believe it was the Mark IV), that had a 3-way adjustable switch for duration (length) of the keyup scream. SSB would be a plus, but not really necessary. I have heard of the Mark II, III, and the IV model, are there others?? I know they have been out of production for a long while now, sure would like to know the info I need..... Thanks in advance..... Maniac "373"

If your amp front end gives you a bad match to your radio dont take it a shop
unless it is broken. Just put a small tunner between the radio and the amp.
Cost less than a trip to the shop, you won't have to worry that someone screwed
up your amp and you will have another cool little box in your setup.
Once you get the tunner in forget about checking SWR between radio and amp.
Just adjust it for best power out of the amp. Before you buy or build one
borrow one and see if it is really going to help.

keyup
> scream??

All of the two piece Browning bases have the "PING" capability, it is
simply feedback caused by the recieve being held open until an electrolytic
capacitor discharges.... The Value of the capacitor is what varies the
ping length...

I read about one (I believe it was the Mark IV), that had a 3-way
> adjustable switch for duration (length) of the keyup scream.

Mark IV in unmodified Factory condition DID NOT have the Ping (scream)
A three position switch would have been a modification that a previous owner
had done.......

SSB would be a
> plus, but not really necessary.

The SSB on the Brownings are not what you might say the best in the
world, working properly they will suffice..... you would be better off
saving the Browning for AM and buying an inexpensive newer SSB rig....

Here are some of the Brownings...
R27/S23 AM only no factory ping need to add!
Compact AM only no factory ping need to add!
Mark II AM unless SSB15 Factory Ping (short)
Mark III Early AM only, later AM/SSB Factory Ping (short)
Mark IV AM/SSB no Ping need to add!
Mark IVA AM/SSB no Ping need to add

Browning had a Seperate SSB Transmitter for the Mark II and early Mark
III's, without this they were am only, to use this they would also require
the transadapter...

I seriously doubt you would find a Browning now days without at least a
short Ping.... Also if you did not know it already, The Ping DOES NOT
function on SSB......

I have heard of the Mark II, III, and the IV
> model, are there others??

Many others, i've only listed the more popular ones.....

I know they have been out of production for a long
> while now, sure would like to know the info I need..... Thanks in
> advance..... Maniac "373"

Yep they have been out of Production since i believe early 80's.....
Expect to pay anywhere from $150.00 to $750.00+ for a decent Browning
depending on condition and model

Good luck

What do you mean" You cant"? Of course you can. It takes a little doing and you need a radio that has been optimised for a 50 ohm load but it is completely doable.

You will need a couple of tuners, SWR meter and a dummy load.
Connect a small tuner to the output of the radio along with SWR meter and 50 ohm dummy load. Key the radio and adjust the tunner for max forward power. The tuner /radio combination is now your RF test source with a known 50 ohm output impedance.Do not make any further changes to this tuner. Now remove the SWR meter and tuner and connect the second tuner followed by SWR meter and dummy load and adjust this tunner for max power out. You have just calibrated this #2 tunner for a 50 ohm to 50 ohm impedance transformation. Now insert the amp between the 2 tuners. If adjusting the #2 tuner causes the output power to increase then the amp was not 50 ohms.Solid state amps usually have at best a ballpark match to 50 ohms. All amps like this in my opinion should be used with some sort of tuner. This gets rid of a lot of harmonic distortion and assures maximum output power and efficency.

Want to actually calculate the output impedance of the amp. Make you own tunner for #2 optimized for the freq band of interest. This keeps the tuner simple. The circuit will be a simple "L" circuit. After the circuit is adjusted to match the amp to 50 ohms the values can be measured and claculations made to see what the ratio of transformation is. An swr meter placed before the circuit will also tell you what the ratio is but will not tell you whether the transformation is up or down. The configuration of the "L" circuit will tell you this. I think if the inductor is in series and the cap is on the output it is a step up network, If the position of the component s are reverse it is step down. The ARRL handbook has some good info on L tuner design and I would check there to make sure.

I had planned to do some experimenting to see what kind of effect the source impedance had on SWR meter readings. I know in actuality source impedance does not effect SWR but I can't help but think it may cause the meter to read erroneously. I have asked several people about this and got there "I know" answers but have yet to find anyone who has actually tested it. The test should

not be anymore envolved than the above test. Just calibrate the #1 tuner for various known output impedances and see how it effects SWR reading of a meter placed beyond it.

------clipped--------

Prof',
I'm afraid an amplifier's efficiency has nothing to do with it's
input or output impedance. A simple comparison measurement if valid
for any type amplifier, no matter it's efficiency. Your method isn't
valid.

There are longer whips available, but getting the SWR
down even lower won't produce a noticeable benefit.

> I believe that the antenna is not breaking
> down, as it has a 500 watt rating and the amp I have is only rated at 100
> watts.

I agree.

I have a K-40 load and whip here that was subjected
to 800 watts in daily use for 10 years. After 10 years
it finally broke down. There is a small hole burned
into the dielectric that you can see when you look into
the connector end of the load. Now, anything over 50
peak watts sends the SWR into the red. Under 50 peak
watts the antenna still works properly.

> Also, signal reports from other CBers are very good with the amp on.
> (I would imagine breaking down of the antenna would cause distortion).

The easiest way to detect antenna breakdown is to vary
the output power while monitoring SWR. At some point
there will be an arc-over and the SWR reading will pop
up into the red. If that doesn't happen, the antenna
is handling the power without a problem.

> My radio shack SWR meter can handle up to 2000 watts, so I guess it may be a
> case of it only being good for measuring power with the amp on, and SWR with
> the amp off.

Radio Shack meters are only good for relative power
readings. In other words, comparing one radio, amp,

or system to another without looking for specific
wattage values. As for SWR, Radio Shack meters are
typical non-linear, diode driven meters. So, as the
power through it increases, so will its sensitivity
and accuracy.

> Thanks very much for the information Bill.

You're welcome.

> KT4ST
>

Actually, your using the term 'angle of radiation' doesn't bother
me at all. It isn't used correctly, but I'm not worried about that.
The 'angle of radiation', or the lowest abgle of radiation refers to
only one of several nodes in an antenna's radiation pattern. All
angles of radiation are measured from the horizontal. You don't
have any angles of radiation 'below' the horizon/horizontal that
amount to anything. Although, there is radiation in all directions
from any antenna, straight up, straight down and every thing in
between. If you have problems with neighbors with interference, you
would do well to take a close look at the condition of the antenna
and feed line. If you instal and tune an 'A99' correctly, you will
have no more, or less interference than you will with any other
antenna. When you don't do it right, you will have problems with
any antenna.
Antenna don't cause 'splatter', radios do.....

The secondary of the output transformer and the output
load cap make up the simple L network you speak of.
I find that the impedance is usually pretty close and
can be varied to optimization by changing the output
transformer turns ratio and changing the value of the
output load cap. Then, any increase in SWR with the
amp on is mainly due to instability, antenna breakdown,
or increased meter sensitivity.

I would like a very small CB as I don't have a lot of room. What's the best deal going as far as size and features? Thanks.

I like the Midland 79-290. It's a dual final radio (good for 30 peak watts without any involved mods) that's modern and is easy to expand for extra channels. The price is good too. If you decide to buy one, buy it from a place that has a decent tech who can do the expansion, tuning, and clarifier mods prior to shipping.

849. Amen to that!

Does anyone have any information on wiring a Pearce-Simpson Super Mod II desk mic? I just bought this mic and would like to wire it for my Pearce-Simpson Bearcat 23C.

Thanks, Rocketman "822" in the wheatfields of Kansas

>hmm.. ok, so something like key 8, swing 35 isn't too bad?

Dead key is the watts shown when you key the mic and say nothing...You probably would`nt want to key that high..A 2-3 watt dead key is ideal...If you ever get an amp a dead key that high will hurt the transistors in the amp

I hope I did`nt brain my damage.

There are on AM. I heard a bunch of over modulated distorted operators on
that frequency this afternoon. They were loud but couldn't understand a
word due to distortion.

I myself HIGHLY recommend this company...but I also would get the the 2950 EX HD. A little more money, but the radio is setup with a lot of good mods. PLUS www.exprotradios.com gives a FULL year on their radios. I bought a 2950 EX HD a Palomar 4500 and a Wilson 1000 mag mount antenna..plus a fan kit and remote for a DX1600 Sweet sixteen...oh yes and a D104MC mic from them. Always got what I ordered and in a timely matter... I know you prob. can get everything cheaper...but I tend to stick with companies that follow through and REALLY answer the phone!!

Not ALL the times do I do this however and I am paying BIG time for it right now!!!

I have no idea about a Delta Force. However I really do like my 2950. It does have one qurik that drives me however. Sometimes when I change the channel the knob moves but the freq's does not. Not all the time does this happen however it is unhandy when you are mobile. BUT I would still by another even with this little fluke.!!

Also to be on the fair side I have a old 2510 which is a very good radio...pretty close tie on which one I like the best. My son swears by the 2510 and I know at least one other here (not to mention and names but (TIM)) likes them as well!!

Sometimes new aint better just newer :)

Whoa! I cannot tell you exactly what kind of antenna you should use. But if you want to take it down quickly, get one with a magnetic mount. Now, you said 80 watts? That sounds strange to me. But I am new to the CB world. So I have no idea what I am talking about critizing 80 watts. I don't know any better.

I just installed a Radio Shack base whip antenna on my RV,
with RG-58U coax. The Radio
is a RCI-2970, when transmitting there is a relay clicking
in the back of the radio.
It seems to pulse the signal. So, is the coax bad, the antenna,
am I messing up the
finals on this radio? Any suggestions or advice?

Thanks, Art...

What do you mean instability? I usually equate this with the amp breaking into oscillation. I am familar with what you are doing but find that an L network gets rid of the harmonics much better than your method as in taking the third harmonic from 20db down to 60db down. If you build it into the amp it has the dsiadvantage of making it a one band amp unless you add a lot of complicated and expensive switching. This makes it even more difficult to convince the FCC it is not a CB amp.

From what I have seen of these types of antennas they are fairly decent and are great if you want a short antenna that will handle a gillion watts of power. If you are not running a lot of power or think they look cool it is probably a waste of money. One thing I like to see in this kind of antenna is at least 1.5 ft between the base and the first coil.

> Its efficiency.

Look at the original post. The man asked how to tell if
an amplifier's output was 50 ohms or not. Now, the idea
is to find out if the output is at or near 50 ohms. There
is a very simple means of doing that which does not require
knowing anything about efficiency, requires only two pieces
of equipment, and a simple meter reading ability. Except
for a dummy load, probably everyone has the equipment to do
this test.
Efficiency of an amplifier is determined by quite a number
of things. While a mismatch on the output can affect efficiency,
there are many other things that affect efficiency also, making
the test using efficiency as the determining factor very un-
reliable.
I don't understand why you are trying to make this any harder
than it has to be, especially trying to use a determining factor
that is so inexact and unreliable. Seems very silly to me.
You can get back on the porch too.....

>YOU are the one who needs SELF examination & repentance !
>Dave!!!!!!

Dear Mr Dave, It seems to me (Judging from some of your other posts) That YOUR in a constant struggle with yourself over how to respond to various issues. Furthermore.....Ive noticed.....on numerous issues, that YOU TALK OUT OF BOTH SIDES OF YOUR NECK. This is an on-going problem with you. Ive RARELY EVER seen any intelligent, compelling, constructive, comments coming out of your mouth. (why is that).....I think its because you've not figured out yet, (that your really not NEARLY as smart as you THINK you are) Ive seen numerous posts, with your name attached, making comments that are TOTALLY off the wall (In content, and substance) Maybe its a hormonal issue, But I would certainly look into it If I were you. Consider yourself lucky that you've found someone in life, that will accept you for what you are, and not for what your about. I really would'nt have written this Re; if you could have said something even remotely considerate, and not totally assinine. Of ALL the respondents to my post regarding "Elion" YOURS was the most "Ignorantly" constructed (In content & Substance) Im Quite sure, after you respond to this,.....You will show your colors.....once again, (Please dont dissapoint me) I really am NOT in the habbit of "ripping" people like this, but I honestly feel that YOU of ALL people out here.....do NOT have the resume or brain power to challenge me in an argument over "Self Examination" "Human Rights" or "Repentance" I will give you the satisfaction of knowing that I DO think your the gold medal winner of "Mindless Bantor" Its better than nothing.....(I guess) I send my warmest best regards, to my fellow Americans on this N.G.....73, Frank.

Hey Art
I've been CB'n in trucks a long time and I've found that for hills and curves a set of cophased Wilson Silver Tip fiberglass whips works best. It gives you a larger area of radiation and they are only 20 some bucks to replace when you break one. THEY WORK JUST AS WELL AS THE 2000 OR 5000 maybe better because they are toploaded. MAKE SURE YOUR DOORS ARE GROUNDED GOOD see the Wilson website. I think a tuned up Galaxy 55 is your best bang for your buck. Just my opinion but on the antenna thing you can spend a lot more money and not get as good a system, don't waste you're money. Good Luck

You might want to start out with something a little cheaper see if you like
it. Maybe look for something used from a friend. Then if you like it and
get to know the equipment you can get something that will suit your needs.
You can gets lots of good advise from some of the operators on this
newsgroup.

I know I'm going to regret this, but I just can't resist. 'Dead
key' means carrier with no modulation applied. 'Swing' means the
total signal, carrier WITH modulation applied. Everybody seems to
more or less agree about that.
If the total signal, carrier and modulation ('Swing') are more
than twice the the carrier ('Dead key') power, the signal is over-
modulated (greater than 100%), and is therefore a 'dirty' signal.
It doesn't matter what you measure the power in PEP, Peak, or RMS,
as long as the readings stay in the same measurements.
(I can hear those 'bubbles' popping ...)

I just heard that old song "buttermilk biskits" by Sir Mixalot
and I could almost swear that it made referance to CB's in it.
I heard the words "mud duck" "maul" and "bird meter"

am I just hearing things?

282 Dallas Tx.

HAHAAAHAHAHAHAA! I downloaded that song thru napster to see what you were talking about. I know I heard 18-wheeler and "3-wide meter". I did here things like "turn up the box" (he could have been refering to a regular radio or CB radio). Insane little song, I will delete it quickly.

Hi There:Just a quick note to get a little info on the power sup. That
you for sale. Is it the same power sup. and speaker combo that would be
compatible with Swan radios ie Swan 250.
If so please respond.
Thanks

Hey, lookie here. The Ripoff Shack has a 10 meter radio advertised as a HTX-10 for $149.99, looks like the same thing as the Magnum 257. I would bet you can't mod the Ripoff Shack model though..... Anyone know about the HTX-10? The RS history book says: if can be modified, we won't carry it!

>YOU are the one who needs SELF examination & repentance !
>Dave!!!!!!

Take a pill Mr Dave, YOU of all people.....are the LEAST qualified to render judgement on repentance, It appears to me that whatever the topic is on this N.G. you seem to have some kind of un-educated, sarcastic, doubletalking comment to say. If anyone on this N.G. were to go back and read some of your posts......they would clearly see that 95% of the time.......your talking out of both sides of your neck. Ive YET to see ANY constructive, educated, comments come out of your mouth. The comments ive made regarding Elian, were fact based, true to life references, If and when your capable of flexing your brain in a courteous, constructive manner let me know, Id be happy to discuss anything with you. BUT........as long as you continue to bash me with your hollier than thou manner.....I will have no choice but to suffocate your double talking bantor, with.....POLITE,.....FACT BASED,.....RESPONSES.
.....To my fellow Americans on this N.G. I wish you ALL the best regards, 73.....Frank.

I own a '91 Exploder myself and I run a StarGunn Ball Mount on mine w/ a Hustler QD-2 Antenna Quickdisconnect threaded onto my 42" or 44" (I forgot the length) PowerStik ride-around antenna. Works really well. Reason why I went this route because I didn't want to run the hassle of re-calibrating my SWR every time I remove the Mag-mount from the truck. You could go the K-40 antenna route like Mr. Hansen said but I just can't stand mag-mounts (personal opinion) period. Besides, with the hot/reflector antenna set-up that I have, ball-mount system is the way for me. My couple of pennies...

When modified they are pretty nice. The clarifier mod is
kind of a bitch (and is necessary), but otherwise they tune-
up and expand easily and are reliable.

Bill I have to agree, the amp should be stable even without negative feedback before you move to the next step, then I believe the negative feedback ought to be added as a precaution, now I know that in the some of the amps with a separate drive stage it is very hard to get them clean and stable without using negative feedback, but if you try real hard and get it as good as possible and then add the feedback what you get is a good, stable amplifier. I do recommend output filtering to reduce harmonics but if it is done right and not over driven the harmonics are really not that bad.

This is true, but the output tuning of an amp can make this "appear" to change on some meters.

> 'Doc

It only takes 2 watts of audio to fully modulate
a 4 watt carrier. Therefore, on a true average-
reading meter, the average output at 100% modulation
would be 6 watts. As for peak output, Dean is
correct. On a true peak-reading meter a 100%
symmetrically (equally positive and negative)
modulated 4 watt carrier will read 16 peak watts.

If you'd like to review the relationships in an
AM signal, the AM Tutorial on my website is useful.
There's a link to it below.

You might ought to read what I said again. It doesn't
matter is you measure in PEP, Peak, or RMS, as long as
you -stay- in those measurements. If your webb page doesn't
say what I said in my post, you'd better review that too.
Don't take my word for it, pick up a text book and read
it for your self.

> > > Checking input impedance is about all youll get with the swr meter
> > >
> > Just for 'grins'... what'a ya bet on that???
> > 'Doc

Just how 'much' are you willing to bet? 'Cuz if you
really want to 'prove' me wrong, do this;
You will need a radio, SWR meter, appropriate jumpers,
an amplifier(preferably with a non-50 ohm output impedance),
and a dummy load rated to handle the output from the amplifier.

1.Attach jumper to radio then to input of SWR meter.
2.Attach jumper from SWR meter output to a 50 ohm dummy load.
3.Calibrate meter, then check SWR. Write it down.
4.Put amplifier in-line between radio and SWR meter, which
is still connected to the dummy load.
5.Turn amplifier on, calibrate SWR meter.
6.Check SWR. Write it down.

Now, if the to SWR readings are the same, then the output
impedance is the same as the radio. We can assume that the
radio's output impedance is 50 ohms. Therefore the amplifier's
output impedance is 50 ohms.
If the two SWR readings are NOT the same, then making the
same assumptions as above, we can say that the output impedance
of the amplifier is NOT 50 ohms impedance.

Now to be fair, you need to decide on how much our bet is.
When you get finished with the above test, my address is good
in the Call Book. Please, no personal checks.

Anyone have any experience with the Magnum 257? Anyone know how to do the mod for cb band?

947. Re: RADAR JAMMER

Newsgroup: rec.radio.cb
Date: 2000-07-06 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <39651BC7.C01ACEC7@qnet.com>
Source record: 42927

Hello Derek: Here is a web site that Sean gave out a few years ago,
and its still on line and doing well.

http://www.escortstore.com/jammer.htm

A Fish Finder, no that won't work. Jamming police radar, can be done,
but you better know what your doing.

The best and easiest way to protect yourself from police radar, is the
use of a good Radar Detector, and keeping an ear out on the local
trucking CB Channel.

If the jamming transmitter is sending out the wrong type of signals
required to properly jam the radar, it could very easily give a unwanted
false signal to the radar officer, allowing the radar to detect you
farther away then normal, with a unknown speed indication. And there are
too many different radar's out there to try to have a one unit jammer
that you could trust.

Here is how traffic radar works in a nut shell:
If the traffic radar has a range of 1/2 mile, with a normal vehicle,
then a good radar detector will detect the radar at a minimum of 1 mile,
and even to 2 miles. This should be plenty of time to slow down if your
are exceeding the speed limit. And save you from forfeiting your time or
money or both, to the local judge.

So the use of a good radar detector, and some common sense will save ya
a bunch of tickets, My radar detector has saved me a bunch of times. The
CB has paid for itself few times also.

Jay in the Mojave

I also react without profanities or vulgarities. If one wished to illicit any type of intelligent response from you, one would indeed be disappointed. You attempt to come across as some type of better-than-you wannabe intellect but succeed only in revealing your own inadequacies by venting your deepest fears, and with proper pondering one may deduce you are more than likely a borderline schizophrenic/paranoid with delusions of grandeur, obviously deep rooted in your psyche, more likely than not infused during your formidable childhood years by a member of your own brood, which damaged and traumatized you so severely that it left you with such feelings of self loathe, shame, worthlessness, and the inability to confront yourself. Said emotions manifest themselves in your biases and hatreds toward others. In other words, you are in one hell of a glass house.

Your example above is 50% modulation. 2/4 = .5 or 50%.

very simple? How many people have 2 antenna tuners laying around? much less understand what is going on
It is a crude way of saying well yes the amp is not 50 ohms perhaps, but it
does not tell you how many ohms it actually is , or the swr...

957. Nonsense rumors on EXports webpage.....

Newsgroup: rec.radio.cb
Date: 2000-07-06 00:00:00 UTC
From: bobby4a7vv@aol.comdex
Message-ID: <20000706130926.17160.00001161@ng-cs1.aol.com>
Source record: 43050

I took a look at an export radio webpage and couldn't believe the nonsense in a "top secret article letter" from one of the worker/owners.....
These "myths" get started from these practices:
Myth #1 -- this one's the oldest in the book, " The guy who charges less than I do sells all refurbished radios, you gotta buy them from me to get a new one".---GIVE ME A BREAK! Anyone who has really been in the business for a while knows that: 1) Refurbs are usually always in a "plain brown or white cardboard box, not the original "Cobra/Uniden" color packaging & by law do not include the new unit warranty info,...2) Refurbs ALWAYS have the serial # scratched off or otherwise defaced by the factory before being shipped out, & refurbs are not alwas available "at will" for any model at any quantity. and 3) Refurbs are almost always NOTICEABLY scratched up etc... they don't put new cases & faces on the refurbs. Much as I hate Copper, they are selling & shipping new radios, although they are probably guilty of occasionaly re-shipping customer returns back out to the next guy(what do you think Radio shack does with the CB you bring back?!)
MYTH # 2) " President Lincolns that sell for less than about $350 are all some sort of rejects..." This rumor started from the Guy in the midwest that distributes President radios... He knew that A1, Ramko & others "go around" him & buy & import them direct from President Electronics of Europe (not "owned" by uniden) & offer better wholesale prices on Brand NEw Factory sealed units, so he had to "come up" with that one.... They do have a better warranty, however you are "buying it" with the higher price.
Myth #3) "Mirage radios are all Galaxy returns with a new faceplate on them"..... Man!, there must be a 15 year old grabbing this crap, hook, line & sinker & telling all his buddies! Ranger makes all of the Galaxy, connex, Mirage & many other similar radios, & builds them to order for whoever pays them. There isn't 1 brand waiting to be "dribbled" out to distributors a few at a time as returns come back! (& it would surley cost the factory more to fix a bad radio, clean it up , build & put on a new faceplate & top/bottom case & re-factory seal it in a different box...ect....than to just make another rig!!)
Galaxy does have a better USA warranty than mirage. I don't even think Galaxy sends ANY radios back to Tiawan!
Myth 4) "The Galaxy Saturn, Saturn Turbo & Pluto aren't "Real" Galaxy radios. (???) These radios are made in the same factory by the same people using the same boards as the "other" Galaxy radios, but they do not happen to be imported into THIS country by the same "people" that import the "DX" series of Galaxy radios. Thats it.
I don't know if the people saying these rumors actually believe this crap, or just want to hypnotize potential customers into not trusting any other shop but their own.....but please give us A BREAK!

> What do you mean instability? I usually equate this with the amp breaking into
> oscillation.

Oscillation is instability taken to the final level.

What I mean by instability is that the amp hasn't
broken into oscillation but is symptomatic, and if
the instability were to become worse the amp would
begin to oscillate. It's not super easy to explain,
but I'm sure you've seen it. At one end there's a
perfectly stable amp whose spurious content doesn't
change whether it's running into a dummy load or a
reactive antenna that's only 5 feet away from it.
At the other end is an amp that oscillates even when
running into a dummy load. In between those two states
is what I see as some level of instability. In other
words, most amps aren't rock stable regardless of the
load and the density of the RF field they are working
in; but, on the other hand, they're not oscillating
either. I see instability as having a varying degree.
In other words, I don't see amps in either one or the
other of two states (stable or oscillating).

> I am familar with what you are doing but find that an L network
> gets rid of the harmonics much better than your method as in taking the third
> harmonic from 20db down to 60db down.

My method involves more than just tuning the output
circuit.

> If you build it into the amp it has the
> dsiadvantage of making it a one band amp unless you add a lot of complicated
> and expensive switching. This makes it even more difficult to convince the FCC
> it is not a CB amp.

I see your point and the effectiveness of the method
you mention. My point is that if one were to strive
for increased stability an additional tuned L network
wouldn't be necessary.

I'm sure you've seen this for yourself, but I'll mention
it for the benefit of the other readers. If you take a
typical solid-state CB amp and run it into a dummy load
it shows a proper impedance match to the load and its
spectral purity is acceptable. Then, you take the same
amp and run it into a typical mobile antenna. In most

cases the spurious content increases and there's an SWR reading that's seemingly indicative of an impedance mismatch. Now you're at a crossroad. You can add an L network (if you can fit it inside the amp) or you can take steps to increase the amplifier's stability. Personally, I prefer the latter because it can always be done and you see benefits in more areas. That's all I was getting at.

960. Re: Linear Amps and SWR

Newsgroup: rec.radio.cb
Date: 2000-07-06 00:00:00 UTC
From: Bill Eitner <kd6tas@freewwweb.com>
Message-ID: <3964C609.6055550@freewwweb.com>
Source record: 43053

The amps you mention are now band-specific.

My point that adding a tuned output circuit to an unstable amp
is masking another problem is still correct. Making the amp
as stable as possible should always be the first priority.
Then, if necessary or desired, a tuned output circuit can be
added.

In their broad-band state, many of the larger solid-state amps
aren't an optimum match to a purely resistive 50 ohm load at
27 MHz. That's why Dave and some of the other amp builders
add tuned output circuits. They aren't doing it to mask an
instability problem. Impedance match and instability are two
separate issues.

That's where this thread started. The original author asked
if adding a low-pass filter or an antenna tuner to the output of
his small amp was the proper approach to lowering the SWR. I
said that since the SWR was low with the amp off the antenna is
tuned and the antenna tuner wouldn't do any good, and that the
low-pass filter would be masking the problem rather than solving it.
I still believe what I said to be correct. With his amp the
impedance match is good. The increased SWR reading is because
of the increase in meter sensitivity with increased power
through the meter due to the use of diodes in the meter and
some instability in the amp. Running the amp into a dummy load
will verify that. If the SWR is high when running into a dummy
load, the amp is very unstable or is a poor match to a 50 ohm
load.

> (I can hear those 'bubbles' popping ...)
> 'Doc

Hey Doc,

Maybe I'm not remembering something correctly, but... isn't the peak power of a 100% modulated a-m transmitter four times the carrier power? If so, that means that a 4 Watt carrier (the maximum allowed by law on 11 meter CB) that is 100% modulated would read 16 Watts on a Wattmeter with true peak detection. Anything more than that is indeed too much modulation, and the signal will be flat-topping and splattering.

Dean,
If you have a 4 watt carrier, and 4 watts of modulation,
you have a total of 8 watts of transmitted signal. That's
a 100% modulated signal. Are you confusing Peak and PEP
power?
'Doc

The two pieces of equipment that you need to make this test
is a dummy load large enough to handle the output of the amplifier,
and an SWR meter. Don't need a tuner, much less two of them.
Your right, it won't tell you what the actual impedance is, but
it will tell you the SWR. If he knew what the actual impedance
was, assuming it wasn't 50 ohms, what would he do about it anyway?
The test only tells you if the output is 50 ohms impedance, or about
how close it is to 50 ohms. That's what he asked for....

I just read your FAQ so I don't feel guilty about asking this stupid question cause it is not answered there.

I just bought a Midland 75-820 cb for my car. I've never owned a cb before. I read where you can modify it to accomodate 120 channels and then I read about another mod that gives you 400 channels.

So here is the stupid question. . . Why would I want to do this? What is being broadcast on all those channels? The FAQ covers the 40 channels but it doesn't answer this question.

>

Lets see...I have a Uniden Madison

4 x 40 channels = 160
Then the in-betweens (the 00's) = 160

AM, USB, and LSB

I have never been able to figure out what the total should be. Do you count
the USB, and LSB as separate channels or are they just the upper and lower
of the channels.

>Average power is the TRUE watt reading (on
>AM Modulation) whereas the scam artists use peak

Don`t listen to this meatball..Peak power is the generally used measurement by 99.9% of CBers.. Every ad,transistor spec sheet,amp makers website,commercial meter builder uses peak as the norm..Oh and by the way..Man never walked on the moon either.Right Dave?..Elvis told me last week

I hope I did`nt brain my damage.

i would bet on it ... the swr ratio remains the same regardless of what power of amp is inline, transistor or tube .. 10 forward watts /.05 reflect, 100 forward/ .5 reflect.. 1000 forward/ 5 reflect .. 10000 forward/ 50 reflect. We are checking the load impedance that ratio should not change with more power being applied.

if your amp sounds so good , i would gladly buy one from you as a driver for my 200 .

but i want #12 to look at it first . i am sure i can gett him to look at it for me , hell i will even pay a bench fee if i have to.

if your amp is all that you say it is , your amp putting out about 60 watts should be perfect for my lil 2 pill .

one question first , is it set up for sideband ?

Wait a minute here! Are we all talking about the same "Sir Mix-A-Lot"?
There is a rapper with this same name. And someone mentioned VH-1 (so he has
to be "known")
Can someone clear this up for me because someone else here said he has an
alias which is "PrimeMinister". So I am not confused.

I just had to stop in & write,
I live in CLT,NC. But, I have
lived in many N.Eastern states.
The blacks here are very rude,
when I hold the door open for them
they never say "thanks" or anything nice.
Sometimes they say, you're learning white boy!

Today Fred Lane(NFL.panthers) was shot to death by
his wife. He was also the guy who refused to stand up
for the national anthem. & did a bunch of other stupid
stuff. One other example is the black guy from the tv show
survivor, he does nothing, but he wants the $.

The confederate flag issue is also stupid, the flag is so
high in the air who looks up there? Now it's down low
where everybody can see it! The NAACP has a boycott
for S.C., to me that's great I'm going to S.C. as much as possible
hope I can away from the blacks.

How about going to the movie theater having the blacks
running up & down the isle & talking out loud.

The list goes on & on. It's not the color
I dislike it's their attitude & culture..

Cheers

Derek

hi again everyone.. 2 things tonight

1, i have a 1988 jeep cherokee.. does anyone with a similar vehicle have a good place to mount a radio? i have mine under the dash on the driver side, all the way to the left.. it's not in the way of pedals, but it's a pain in the ass sometimes to switch channels since i'm right handed and can't do anything with my left!!

2, since i have this really nice radio finally, what kind of antenna's would you people suggest? something that can punch my signals out there. preferably, something that won't look too bad on the jeep.. and where would be a nice place to mount it?

thanks again everyone for your help, i really appreciate it

derek

1015. The Sir Mix A Lot situation, please read this people

This is in response to the earlier thread about the "Buttermilk Biscuits" thing. If you dont know what I am talkin about, go back thru the earlier threads. The name is "A song I just heard mentioned CB".

Ok, this shows how stupid my self and a few other people are. I finally listened to the song CAREFULLY while reading the complete lyrics from Yahoo: The only "reference this song has to CBs to me are some of the strange word combinations (maul dropper, mud duck stopper, etc.) and 18 wheeler (just to throw in a stereotype). This song is more of a parity of rap music, country line dancing, and good ol southern eatin (well, biscuits for one thing and he mentioned KFC). Just read and listen to the song and yo will see. And to think I got all worked up (making 3 stupid ass post, i feel real dumb) thinkin this guy was making a reference to CBs (it is bird WHITE meter, not bird WIDE meter). Oh well, this was just a post to clear up this Sir Mix A Lot and CB radios thing.

Artist: Sir Mix-A-Lot
Album: Swass
Title: Buttermilk Biscuits

Now I'm your big mal dropper, mud duck stopper
Fila on the bottom and Adidas on the topper
Transform scratchin', big beat matchin'
I can tell you're getting jealous by the look I'm catchin'
I hate dumb skeezers, MC beater
Drop 5 grand on my bird white needer?
Smooth like ice, don't get nice
Just turn up the box for the Mix-A-Lot slice (huh huh)

Y'all ready to get busy? (huh huh!)
Now, buttermilk biscuits here we go
Zip the flour roll the dough
Clap your hands and stomp your feet
Move your butt to the funky beat (huh huh)

Buttermilk biscuits (x 3)
(Lord have mercy Mix-A-Lot's our here rappin' about biscuits now)

We from L.A. to the Carolinas
Dip them suckers in Aunt Jemima
Don't make a difference what food you make
Use buttermilk biscuits to clean your plate
You eat 'em in the morn', you eat 'em at night
Kentucky Fried Chicken makes the suckers just right
I am eat 'em with jelly it's my favorite deally
Wrapped and sealed by a freak named Shelley (huh huh)

Buttermilk biscuits (x 3)

One day I kissed my freak, hit the street
Looking for something to eat
In a 18-wheeler, lookin' real swass
All the girls smile 'cause I'm the big boss
And I gotta eat now, can't eat later
Made a lot of noise to attract my waiter
The boy walked up, and what did he say?
"Say, buttermilk biscuits free today!"
So what you waitin' on boy, get up shake a leg
Gimme 10 of them suckers with grits and eggs
A glass of Koolaid and a whole stick of butter
Them biscuits make me a superfast cutter (huh huh)

Now grab that can and wrap it in your hand
Bang that sucker till it don't expand
Cook them suckers up in your oven
Grab your girlie and get a little lovin'
Add a bag of honey if you want to get funny
Microwave the suckers if you want your honey runny
Kinda get naughty at the Mix-A-Lot party
And rub them suckers all over your body (huh huh)

I never heard of one having a "scream". The Mark IV that I owned didn't have a "scream" or any kind of switch for one. I know certain models had a "ping" when they were keyed. This, I believe was caused by a capacitor. The only screaming that was done was by the operator having to put up with all fussing around needed when changing frequencies,especially on SSB.

Stability without feedback with todays high-gain transistors
in an RF dense environment (a nearby mobile antenna as the
load) is alot to ask unless by stable you mean not oscillating.
I agree that output filtering is nice as long as it's under-
stood that the amp will no longer be broad-banded.

I read it right the first time. The relationships and
equations stand regardless of whether or not you "stay"
with one measurement mode or not. I really wasn't dis-
puting that anyway.

> If your webb page doesn't
> say what I said in my post, you'd better review that too.
> Don't take my word for it, pick up a text book and read
> it for your self.
>

You're getting pretty quick on the defensive trigger,
aren't you. I think it's you who needs to review what
you wrote and the relationships in an AM signal. You
also need to relax--this is only chit-chat on a news-
group--it's not worth upsetting yourself over.

Here's what you wrote:
Dean,
If you have a 4 watt carrier, and 4 watts of modulation,
you have a total of 8 watts of transmitted signal. That's
a 100% modulated signal. Are you confusing Peak and PEP

power?

This is clearly and totally wrong. My post corrects
it--that's all there is to it. I wasn't lashing out
at you--just making a simple correction and suggestion
to you as well as the original author and anyone else
who read the post.

I LOVE my Palomar Cobra 4500 HD. YOu can expect 450+ with it. I drive it with a 2950 and have pretty good luck with it. I bought mine at www.exportradios.com. You may be able to get them cheaper but I do like dealing with this comapny!!

You sure can tell the new folks on here! Less than a year ago everyone posting knew who "Prim" and Sir Mix a lot was. All his songs have been discussed in detail and his interview on VH1 not to mention his big station and Skullcracka amps he builds. Now it's like all new information again! What will be next? Someone asking what a Skywave amp is and who built it? Who runs Real World Electronics'? What the heck does #12 mean? Does the Train posting on here build the Train amplifiers? How long does your coax have to be? WOW how time seems to fly and turn over a whole new group! Is a guy named Chuckie good to buy amps from? Who ever heard of a Cookie amp? What is a Blackstone amp? A guy named TOLL used to give out FREE technical info on here too! Whew! Time fly's! I need a Painkiller.....

again you make fun of blutarsky. this is veryt bad. you will be
explained the capoactor in a way you can undersntand.

1 the capactoir makes tuned circut
2 with inductnce atthe antena base
3 noise and signl is now down to nothing
4 and swr problem is gone
5 no coax

construvtion is in a small box outside.

this is what hams use with good result.

Doc all your post did was show just how ignorant you really are towards all this. For starters
i use a meter that needs no calibration a bird meter, with a dual line section that means you put a "slug" in both the forward direction for reading power and one in the reverse direction to read reflect watts it is not a el-cheapo meter where when you apply power you get bogus readings and are fooled

Source record: 42978

OK, how the watts is measured doesn't really matter. But where does this 4 times the carrier in ssb and other crap.

Lets take a typical legal CB. The measurement is usually taken in PEP. So you have a 4 watt Am signal modulated 100%... 4 watts used in USB 4 watts used on the carrier and 4 watts in LSB. BUT you still have only 4 watts out!!

You first have a carrier, then a upper side band and a lower side band. That is THREE sections to an AM signal.

Now, you remove the carrier, 1/3 of the power not needed (4 watts), then say you remove the upper side band another 1/3 of the power not needed (4 watts).

What you have left is LSB, 4 watts plus another 4 watts for the unused USB and 4 watts not used for the carrier. Well what we have here we have here watts added to the LSB equaling 12 watts!!!!?????

Well low and behold we now have a 12 watt signal which just both happens to fit into the legal category only by virtue of simple math.

But others come in with mods and talk about swing etc. change the AM bias to jack up the the watt loss in AM. but that doesn't change the basic structure of Am and SSB.

If you key up Am you have a fixed carrier, If you have swing then you have either over modulated the carrier or have install extra circuitry to compensate for the less efficient AM mode. The only place you should have true swing is in either USB or LSB Mode.

So what is it are we talking here?...
basic Am verses SSB or modified AM and
SSB. There is either/or but not both...
you still start with the basics in every
radio mods or not. Not one post has made
that clear and some indicate that they
wore NOT even aware there is a
difference!!!!.
Cheers,
John

Well, save your money...

Do they work? You bet! Are they effective? If you mean helping you save your money and avoid tickets, save your money.

You CAN jam, and jam easily, but it's not practical.

First off, almost ALL the current RADAR guns have RF detection circuits that can spot jammers. A lot even have a JAM detector that looks for the pulse mode saturation a speed insertion jammer would use. Want to find out what happens when you REALLY piss off a cop? Let his JAM detector go off!

Secondly, MOST of the 'so called' jammers just generate a bit of noise that is supposed to give you an 'edge', but that edge is just an extra fraction of a second when you're at the extreme range of the radar unit. Do they work? They do EXACTLY what they advertise they do, and NOTHING more. They will NOT protect you if you blow around a corner into a trap. They will NOT work if you get nailed as you come up on an officer and he aims the instant on gun at you. They are marginal at best, and even then ONLY when they are aimed RIGHT AT the radar unit.

Laser jammers? I've heard they are less effective than driving with your high beams on durring the day. (High beams have a very high component of IR. Driving lights do too. And remember, daytime running lights are a SAFETY plus!!) Flood the area with IR and you raise the noise floor and lessen the laser range.

OK, jammers that put up a 'selected' speed on the radar gun? They are out there, but they work independant of your speed. Forget to turn it off, and the RADAR will read the selected speed while you're actually sitting still! And since the method used is independant of doppler, they are not affected by your speed. (Most of them anyway. These use a method that pulses at the radar gun and overloads the IF, causing the mixer to count the pulse rate instead of the doppler difference product for speed. True RF shift jammers are VERY complex, but can actually work with much lower RF power and are actually much harder to detect. But these have to be interfaced to the vehicle to know actual vehicle speed, and they have to be able to mix off the incoming radar signal (otherwise they can't accurately offset) and do it FAST enough to get the signal back at the gun. Not cheap!)

Overall, 99%+ of the so-called jammers out there are BS. And
the few (VERY FEW!!) that do work (and aren't detectable by
the RADAR guns as jammers) are NOT sold by outfits that
advertise anywhere you're likely to see them, or be able to
afford them.

> What swr does your assumption tell you it is?

"TheGame",
I'm glad you told me how ignorant I am. 'Cuz I didn't even
know that Bird made an SWR meter! They make a lot of watt meters,
though. You can use a forward and reverse reading watt meter to
do the test I suggested, but then you have to do some conversions
to end up with an 'SWR' reading. Of course if your using one of
the newer 'Birds' that can read PEP, you might want to switch
back to RMS. Still works if your measuring PEP, but the RMS route
is much simpler to 'see' the math.
I do have to say that with the test I outlined, and assuming
that the output impedance of the amplifier being tested isn't
50 ohms impedance, there's no way of telling what the SWR will be,
or what the actual impedance of the output is. But, that wasn't
what was being looked for anyway. He just wanted to know if the
amplifier's output was 50 ohms or not. This test will tell you
that. Please don't 'read' more into what I said, than what I
actually did say. If you do, it just makes you look ignorant
when you go back and read what was actually said.
Thanks again for pointing out my ignorance!
'Doc

People tend to blame the amplifier because that's typically
the reason with a lot of the "CB" amplifiers. Hey, don't blame
me, blame the people who make 'cheap' amplifiers. By the way,
that 'cheap' doesn't mean price, it means quality.

Can anybody tell me what topics "CB Tune Up Manual Vol. 5" covers for the Uniden PC122XL ? Does it contain any circuit diagrams etc. and is the manual worth buying ?

Thanks,

Richard.

Cross-posted to: alt.radio.cb.skip,rec.radio.cb,rec.radio.swap

Been busy dumping the big stuff but I still have four classic mobile tube amps: Golden Falcon 400A, Palomar 310M, Hy-Gain 640 "Footlocker", and a very cool custom remote-head Hy-Gain 640 "Footlocker". Check the details and photos at www.hightechspecialties.com . Inquire via email to: toomuchstuff@pobox.com Need to dump them quick so make serious offer and they're yours. thx, Jon

1065. What type connectors and coax do all the Big Starps USE?

From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <3965DFE0.EE33D2C1@qnet.com>
Source record: 42995

Hello All: Anybody know what all the "Big Straps" use in the way of the larger high power handling coax like RG-217, RG-218, RG-219?

What about connectors?

Where to buy them?

Thanks for any help here.

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station.

Message-ID: <pSo95.6066$EV6.144961@typhoon1.ba-dsg.net>
Source record: 42996

RG 213 is more than adequate for up to and over 5kw rms if you are real long on the key rg 217 will be better up to about 10 kw rms , after that rg 218 would be prefered , the end connectors for rg 218 are about 70.00 each you would need to use an LC connector with this, rg 213 and rg217 both can use regular uhf pl-259 connectors ...

So Andy........ What your essentially saying is that MOST if not ALL
Power increases done on a CB radio are incorrect and actually DON'T provide
an increase in the power output????

Also your saying that if an SWR reading changes when the carrier is
modulated the radio HAS BEEN improperly set up???

Please clarify these two points

Thanks

KW

I agree with you almost completely, except your statement regarding being a HAM.... CB did NOT corner the market on RACISTS, plenty of it occurs in the Ham fraternity! And as for conduct on the NG's all one has to do is read both the Ham and CB NG's, and you will certainly see that both have intelligence and ignorance......

It has no driver section, the 500's are straight 4x2879's same as a 667 without the driver section... I would say 100 watts SSB is kind of pushing it, you could probably get away with it, especially considering your Yaesu probably would only produce that level of power occasionally..... and average output would in reality be much less..... Texas Star themselves would reccomend The sweet 16, they claim 100 SSB and 35 max AM.....

Source record: 43008

I have got an Eagle Spitfire 454 10 meter handheld radio. I love the radio...its really neat to play with, like a 2950 in a walky talky, but the modulation could be a little louder. Does anyone out there know the exact location of the modulation limiter for this radio. Also, has anyone with one of these radios or one of its many variants who has removed the modulation limiter had any problems afterwords, like raspy crapped out audio on SSB?

Its all surface mount components...so a little hard to tell whats what just by looking. Thanks

Message-ID: <20000707141110.16097.00000258@ng-mb1.aol.com>
Source record: 43098

OK, I never said that a filter or L network would fix a stability problem. It certainly will not mask it either. This type of problem means something is broken or there was just poor enginnering from the beginning. Somebody said something against using negative feedback to fix stability problems. I dont understand what is wrong with this. Negative feedback is the time proven method of stabilizing an amp. This makes perfect sense because most instability is caused by positive feedback. Of course if the amp is just poorly constucted or designed these factors should be taken care of first by reducing the amount of postitive feedback through proper component orientation, shielding, grounding, bonding, ect.

> "TheGame",
> I'm glad you told me how ignorant I am. 'Cuz I didn't even
> know that Bird made an SWR meter!
==========
Stick around and i will learn you, what is a swr reading? well it is the ratio of forward power to reflected power, and with a bird meter and line section you have "elements" that read forward power when used in this direction, and will read the "null" which is the reflected power when the "element" is turned the opposite direction.

>They make a lot of watt meters,
> though. You can use a forward and reverse reading watt meter to
> do the test I suggested, but then you have to do some conversions
> to end up with an 'SWR' reading.
==========
What conversion do you have to do? I have a digital reading "Bird" meter which does this calculation for me it knows what slugs are in use, the forward power and the reflected amount of power, with this info you have swr ... NOT Too hard, or for those that don't have this bird supplies a simple slide ruler. not real hard either. And there you have it a Accurate SWR reading.

>Of course if your using one of
> the newer 'Birds' that can read PEP, you might want to switch
> back to RMS. Still works if your measuring PEP, but the RMS route
> is much simpler to 'see' the math.
==========
New ones? Any bird meter can read peak or rms they sell a circuit board that attaches to the meter itself ...
of course you would use rms.... why would you want to use peak ?

> I do have to say that with the test I outlined, and assuming
> that the output impedance of the amplifier being tested isn't
> 50 ohms impedance, there's no way of telling what the SWR will be
> or what the actual impedance of the output is.
----------==========
Now you are Back peddling , thats what my arguement was the whole time... In no way can you determine the swr or output impedance.

> But, that wasn't
> what was being looked for anyway. He just wanted to know if the

> amplifier's output was 50 ohms or not. This test will tell you
> that. Please don't 'read' more into what I said, than what I
> actually did say. If you do, it just makes you look ignorant
> when you go back and read what was actually said.
> Thanks again for pointing out my ignorance!
> 'Doc

==========
"how do you check to see if your amp has a 50 ohm impediance " i believe is
what he said to qoute #22
"
"An easy way is to connect the radio through an SWR meter,
to a 50 ohm dummy load. SWR should be 1.1:1 or there-abouts.
Now you know the output of the radio is at or near 50 ohms.
Remove the dummy load, substitute the amplifier, now see what
the SWR is. If the input to the amplifier is at or near 50 ohms
the SWR should be the same as with the dummy load."
'Doc"

Is what you said, reread your ignorant quote again,

1101. FS:Ham Radio Equipment Kenwood 10 to 80 Meter Transceiver, TenTec 10/80 Meter CW...

Newsgroup: rec.radio.cb
Date: 2000-07-07 00:00:00 UTC
From: patddd@my-deja.com
Message-ID: <8k5a6r$29b$1@nnrp1.deja.com>
Source record: 43106

All equipment listed comes with Manuals and other documentation...

This is a Kenwood TS-520...
Well taken care of...
Comes with a Shure Handheld Mic...
Powers up and receives not sure about transmit... Never tried...

The Ten-Tec CW Transceiver is in real good shape as well... Powers up
and receives haven't tried transmitting on this either...

Also available in the package is a Dentron Super Tuner...

All this is going to for $250.00 At this price it is a great deal even
if they need some work...
I bought them from a guy that told me everything was in "tip top shape"
and I have no reason to doubt him...

I need the $$$ so have to let them go...

1102. Uniden PC122XL - Can the LSB/USB Frequencies be set seperately ?

Newsgroup: rec.radio.cb
Date: 2000-07-07 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <mbq95.25445$qS3.52864@tor-nn1.netcom.ca>
Source record: 43107

I have been told that my LSB is slightly off frequency but my USB is fine.
Can anybody tell me if it is possible (and how) to adjust the LSB seperately
?

Thanks,

Richard.

1103. Re: SWR on base station

Newsgroup: rec.radio.cb
Date: 2000-07-07 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <39662ab7.4438168@news.iserv.net>
Source record: 43108

Greetings!

It's uncommon to see a base antenna reflect SWR like what you claim.

Has it rained in your area when this problem occurs? Could be moisture in either the antenna or the coax.

Has the problem recently cropped up? Or has it been always a problem?

In a recent installation this is normal - you just have to re-tune the antenna to get the bugs out of the system. Or double check grounds and connections to make sure they are good.

If someone did a solder job on the coax for a customer. The coax may not be at fault, just the connections [those PL-259 connectors].

The coax connections may be faulty and should be cut off, coax stripped, and re-done again. THAT IS IF THE COAX WAS CUSTOM CUT AND MADE FOR THE CUSTOMER.

If this is a pre-done coax, with molded connectors, then the problem may not be the antenna or the coax.

Don't blame the antenna first, the wildly fluctuating SWR when you talk may be an indication of a more serious problem inside the radio.

It may be a hack job done to the radio - some peak and tunes done to radios can easily affect SWR like what you see when you talk on the radio...

The modulation produced by talking into the radio, is a sum of varying power levels in both voltage and current of your voice being applied to a carrier your radio produces when it transmits.

If someone played around with the radio and changed the output network - either by twisting coils, or changing capacitors, you should return the radio back to where you, or your friend, got it. Have it returned back to stock.

I am finding a lot of used radios that have been supposedly "Peaked and Tweaked" that show a higher SWR when modulating the carrier than just throwing a dead carrier. The job isn't done right, and needs to be fixed.

Throwing the radio on a dummy load, doesn't re-create the problem, it is created when you use a reactive load, like an ordinary CB antenna.

A good way to find out if the radio is really at fault, is to look at the back of the radio, over by the antenna connector. You'll see a series of coils and capacitors. Follow it back to the final and that entire section at the back panel is the output network.

See if any of those coils have been pried apart [separated windings] remember the way it looked when you first checked and squeeze the windings back together and re-check SWR.

Another thing to look for is if the capacitors are changed to a different body color than what is in the rest of the radio.

Not sure of the radio you're using - so I'm thinking that if the antenna is ok, the radios final may have been modded or "swapped" out - most finals in a CB radio are 2SC2078 types some places put in a 2SC1969 final - to get more power out of it.

Check the solder job done on the foil side of the radio, look for shorts, or recent [shiny] work done to the section.

On a typical CB radio from Cobra, Midland, or Maxon, even Uniden, they use disc capacitors with markings on them. Most radios have standardized output networks now, so if the radio is of recent vintage - as in post-1995, the output network contains two coils and two caps.

The caps should be of 390pF or marked as 391 on their body.

I've found problems like yours, and many of the are due to changing the caps to a different value in this area - like 330pF or 331 written on them. They change them to supposedly get more power, but it's not the true case, they get this "extra power" by throwing out a 2-nd harmonic [52MHz] because the power of the harmonic is adding to the power at 27MHz. It can be seen on any power meter you use.

Sorry this is a long message, it's a lot to read. And for a first timer not an easy one to understand. Get some help over there, have them check out the radio to make sure it's working like it should.

1105. Re: Linear Amps and SWR

Newsgroup: rec.radio.cb
Date: 2000-07-07 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <39663317.6582779@news.iserv.net>
Source record: 43110

Greetings!

On Tue, 4 Jul 2000 11:09:21 -0400, while the modem was pondering it's navel, "Richard Smith" <rsmith@planeteer.com> dissertated the following:

>Could somebody tell me why my SWR is higher when my linear AMP is on,
>compared to when it is turned off ?

It's simple, a series of events...power fron the source, is being applied to the input of a complex impedance.

In order to meet the proper impedance of both, the output impedance of the source [CB radio] and the input impedance of the amp need to be equal.

You don't always get that.

>My theory is that the AMP is possibly introducing harmonics into the coax,
>and being as the antenna is not tuned for them they are being reflected and
>causing a higher SWR.

A likely cause, but then - has the radio itself, been optimized to use the amp?

Most amps can't tolerate a wildly varying power - at least they don't like it.

Most CB radios pass thru 4 watts, with up to 16 to 22 watts total PEP power when audio [while you talk] is also applied.

Thats a considerable range of dynamic power that the amp has to accommodate and compensate for.

Thats why I recommened that you have the radio re-tuned to reduce this power problem to help the amp meet your needs.

Sure it may reduce power below stock levels when you don't use the Amp, but you need to make some sacrifices to make this system work.

>Would a low pass filter help or would it just be better to purchase an
>antenna matcher ?

I'd use both. Pair them together at the radio or the amps output, and Swap them around, tuner to amp, filter at output, then vicea-versa to see how SWR is affected, and use the best combination.

Hello,

I have placed some updates at my homepage.
Included a new page about APRS on the Dutch CB band also.
It is all in english so it shouldn't be too difficult to read and
understand.

The url is: http://www.casema.net/~ga3dhg

Soon there will be some more downloads available. At this moment there are
only some packetradio programs available.

Greetings and don't forget to sign the guestbook.

Andr&#65533;

Now I remember why I became a ham
It's not a matter of black and white , Its a matter of conduct.
It's amazing to see how many people that responded to this string in an
effort to voice their own prejudices .
Well I'll tell You this My father is a black Man that fought in WW2 beside a
white Man and a Hispanic and they had no problem with what they were
fighting for and that was for the freedom of ungrateful hate mongers like
the likes of everyone on this string.
Racism is a cancer that has no cure . there will always be people that feel
threatened by their surrounding's and it doesn't matter weather if the color
of one's skin is different or the same .
I consider Myself blessed that My parent's had enough respect for their
children to not share whatever prejudices they may have had against anyone
else and to allow us to judge and choose for ourselves the direction in
which we will rear our own children.
to read some of the thing's here are very disturbing and it makes me wonder
if WW2 was really worth the effort.

> 4 watt carrier.

Take a simple 4 watt carrier, graph it. A simple s watt sine
wave, graph it. Now combine these two signals with vector math,
and graph the result. You will see a classic graphical
representation of 50% modulation. Do it again except with a
4 watt sine wave... 100% modulation.
You can see the same thing if you combine the two signal and
read it on an osciliscope. Don't take my word for it, try it
your self.

They sound like crap. Overmodulated, hard to understand, not speaking in
cohesive english, instead rambling, using the word "worldwide" as often as
possible, acting totally stupid, the list goes on and on.

> >

> Sometimes they say, you're learning white boy!

Don't you know? Most blacks seem to think that we (white people) owe them
something. If it weren't for the whites bringing them out of slavery and
into North America, they would not even be here. If they do not like
America, go back to Africa. There you can have all the disease, poverty,
lack of education, lack of health care, lack of everything you want.

>
> Today Fred Lane(NFL.panthers) was shot to death by

South Carolina sounds like a damn good vacation spot to me.

>
> How about going to the movie theater having the blacks
> running up & down the isle & talking out loud.

Typical again.

>
> The list goes on & on. It's not the color
> I dislike it's their attitude & culture..

The attitude is totally correct. For instance, if I see a friend of mine in
a busy store, I will walk up to them and talk to them. Most blacks instead
will yell or shout at them from a distance of 20, 30, or more feet.

they are x / k/ ka band transmitters , a schematic would not really help
you unless you know how to build wave guides, have access to gunn diodes and
have a absorption meter handy to set the freq etc. In other words its not
practical i can get you an actual transmitter to set off radar detectors
just mount it under the hood and flip a switch and presto instant brake
lights or go rip one out of a store they are used to open and close the
doors at supermarkets and sit right over head as you go in or out. Ever
wonder why your radar detector goes off in front of a strip mall or super
market?

Be careful what you say next time you go into a restaurant, you might not know who is cooking your food. What are you going to do, stop eating? What about if you get sick and have to go to the hospital and the doctor on staff is colored what are you going to say "no thank you"and leave? O yaa, you talk about what all the colored people do. My father is a W.W.II vet and fought side by side with them. many of them lost their lives so you can have the freedom you do right now. Maybe you ought to thank them!

1128. Re: Uniden PC122XL - Can the LSB/USB Frequencies be set seperately ?

Newsgroup: rec.radio.cb
Date: 2000-07-07 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <396659fc.16541478@news.iserv.net>
Source record: 43133

Greetings!

Here's a quick way to determine which coils need to be eeked...

This is a long one, so read thru this ENTIRE message first, before attempting this mod.

You need...

Metal tip flat blade [small tip like those used for glasses repair]
Spare radio w/power supply or base radio,
2 dummy loads of 50 ohms,

Remove the speaker-side case of the PC-122.

Hook up the other radio with a dummy load - key up the radio to produce a dead carrier on a non-busy channel

Connect power to the PC-122...

Turn on the PC-122 and tune to the channel the other radio is on.

Listen to the results, as you turn the clarifier - if the other radios' microphone is sensitive enough you should hear some background audio as well as a hetrodyne. If you don't get enough signal - remove the PC-122XL's dummy load and use a small length of wire instead to help improve signal gain.

Step 1...
Turn the clarifier to remove the hetrodyne, and you might hear a "beat" as the PC-122 tunes to the audio sub-carrier of the dummy-loaded radio. This beat is normal and can provide the "tone" to help you align the LSB side.

Once you find the "proper" tone [solid tone] for feedback, this means you've located the clarifier to the proper audio sub-band for USB.

Without touching the clarifier - switch the radio to receive LSB - you'll probably hear a tone or a squeal - it's normal. You want to create the "pure tone" you heard on USB, on LSB.

On the PC-122 - you have six coils. Each one pairs with the other in this fashion...

Near the front of the radio - by ribbon connector to front panel on the radio. You'll locate six coils - with the front panel facing you component/speaker side up -

```
____ ____ ____ ____ ____ ____
|1a| |2a| |3a| |1b| |2b| |3b|
---- ---- ---- ---- ---- ----
L15 L16 L17 L20 L19 L18
```

L15 or 1a - AM - PLL IF
L16 or 2a - USB - PLL IF
L17 or 3a - LSB - PLL IF
L20 or 1b - LSB - Audio IF
L19 or 2b - USB - Audio IF
L18 or 3b - AM - Audio IF
[Please note that LSB coils are the center two]

Now, if people we're saying that you were just slightly off freq, but audio was ok, take the metal tip of the screwdriver to coil 3a - and the sound you hear will change it's tone/squeal to higher or lower pitch - usually lower, as you place the tip into the coil form to adjust the coil.

[The tip of the screwdriver is altering the tuned resonance of the coil - causing the change in tone...]

Adjust 3a to match the tone you hear on USB. DO NOT ADJUST THE CLARIFIER DURING THIS TEST - else you'll have to start back at step 1 and re-adjust the tone heard on USB to proper "pure" tone/squeal.

This trick get's the radios SSB portion to match both sides properly as done by ear - which is a lot more accurate than todays frequency counters.

If you need to align the AM side - it takes a lot more than described here.

TO unlock the clarifier, cut top trace [component side up - clarifier control is on the right] the top trace means closest to the edge of the board towards the top. This 3rd leg of the pot is the RX voltage supplied to the clarifier.

Now, there is a hole on the main PCB, by the PLL - that is over the trace of the 8 volt constant that the PLL uses - you should use this 8 volt constant. Only you should also use a 1% tolerance 1K 1/4watt rated resistor to drop voltage to 6.7~6.2V that the clarifier uses. One side of the resistor to the hole in the main PCB for 8 volts, and the other goes to the top solder pad to supply constant voltage for the pot to replace the trace you've just cut.

Clip D25 - the one that supplies the voltage from the TX freq adj pot - on front of main PCB to the left side of the ribbon cables. This completes the mod for unlocking the clarifier.

As far as slide? Dont' plan on too much of it. In fact, it's less than the previous versions - but plenty enough to get you in close to the other stations in the roundtable.

I'd put the above stuff in the web page at
http://www.iserv.net/~codyspc/PC122XLmods.htm - but I got yelled at by
my ISP about hogging up more than my share of space on their server.

On Fri, 7 Jul 2000 15:26:53 -0400, while the modem was pondering it's
navel, "Richard Smith" <rsmith@planeteer.com> dissertated the
following:

>I have been told that my LSB is slightly off frequency but my USB is fine.
>Can anybody tell me if it is possible (and how) to adjust the LSB seperately
>?
>
>Thanks,
>
> Richard.
>
>
>
>

Regards!

Negative feedback should be used for gain leveling across a wide band. I
agree the amp should be unconditionally stable before that is undertaken.

No... it's only lonely at the bottom... where you are.
If you don't know that impedance matching is paramount in an amplifier
design... then you probably don't know much about amps!

Any of the Uniden radios shouls fill your need, let your pocketbook dictate which one, if you need a more specific recommendation a little more info from you would be nice, IE: Budget, how serious you intend to pursue hobby etc.. However don't forget the antenna should be a major consideration.....

for a quality entry level mobile system with some room to grow i would say Uniden 68XL or 78XL and a Wilson 1000 antenna....

A negro that has attained the position of a medical doctor has obviously
accepted white culture and agreed to abide by its rules. Therefore he/she may
be considered as white for some purposes.

Well thank you.

I only write what every white person thinks in their head. They just refuse to say it or admit it.

All you white folk out there need to think about the last time a negro cut you off while driving. What was the first thing that came to your mind? You thought, "Fucking Nigger." Any white person that denies this is lying to everyone, including himself.

Perhaps white men need start impregnating negro women. After all, half a negro is better than a full negro. If the negro race continues to divide, it could slowly be fazed out.

I never said you did.

> It
> certainly will not mask it either.

In many cases, mild to moderate instability shows up as
an increase in the spurious content. The increase in
the spurious content shows up as an increase in SWR when
the load is a tuned circuit (like an antenna). A low-
pass filter or a built-in tuned output circuit will
lower the SWR reading by filtering some of the spurious
content. I see that as a masking effect.

> This type of problem means something is
> broken or there was just poor enginnering from the beginning.

I more-or-less agree. A mislead attempt to produce
maximum output at any cost equates to poor engineering.

> Somebody said
> something against using negative feedback to fix stability problems.

That certainly wasn't me.

Many CB amp designers/builders don't understand the
concept of phase shift or the resulting positive
feedback.

I'm glad you didn't get sucked into agreeing with an aggressive
explanation.

There are four good reasons why the SWR will change with
increased output power: non-linear devices in the SWR meter;
instability in the amp; antenna breakdown; and, an impedance
mismatch.

1161. Re: SWR on base station

Newsgroup: rec.radio.cb
Date: 2000-07-08 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <3966cbf3.237546@news.iserv.net>
Source record: 43041

Greetings!

Yes to both, details below.

On Fri, 7 Jul 2000 19:09:18 -0500, while the modem was pondering it's
navel, "killrwat" <killrwat@dwave.net> dissertated the following:

> So Andy........ What your essentially saying is that MOST if not ALL
>Power increases done on a CB radio are incorrect and actually DON'T provide
>an increase in the power output????

Power increases without proper tuning. [Disclaimer]

Essentially - when the radio is modified to produce a higher level of
power, some sacrifices are made.

When someone attempts to modify a low-power [e.g 4 watt CB]
radio to produce more power, it's how it's done is the
problem.

The Final transistor sees a very different impedance than what
was originally expected - and the manufacturer doesn't
accomodate the necessary changes needed when the network is
re-tuned to produce more power than it's original design.

Let me put it to you this way,
changing tire sizes on a vehicle, changes the tourque and
overall power the engine can deliver to the wheels. Although
you may save some gas in the economics of using a larger size
you can lose acceleration in the process. You can waste the
gas you save, by attempting to have the same acceleration.

The above analogy is the best way I can describe the results
of re-tuning an output network to hopefully deliver a greater
level of power to the amp.

You sacrifice the filtering and impedance matching the radio
is originally designed to deliver into - to obtain a power
increase that produces harmonics and less quality - or clean
signal. Hence: SWR problems that are not always the cause
or caused by, using an amp.

Key words about the point of view I'm making here, is called
Dynamic Range and Bandwidth - once audio power, or overall
power the radio produces is changed, the dynamic range and the
overall bandwidth of this signal is also affected.

Dynamic Range? Limiting the range of power levels produced
or using a limited range of gain, maintains the stages of
amplification to reduce distortion caused by forcing the
preceeding or successive stage to saturate it's output.
And if not filtered or limited, not only affects the overall
distortion, but increases harmonic production.

Bandwidth? To a lesser degree, but is something that also
needs to be considered. Excessive bandwidth results in
splatter, but also this element, or factor, occurs with
the production and amplification of the 2-nd harmonic or
any n-th level of harmonic produced when a broadbanded
amplifier is used.

Basically, the manufacturer designed the successive stages
to have limited gain amplification and only at a given
bandpass to the next stage to keep impedance and power
levels within not only the class, but within the operational
window of the stages, to avoid harmonic production.

> Also your saying that if an SWR reading changes when the carrier is
>modulated the radio HAS BEEN improperly set up???

In light of amps/Linears, yes. But, it's too easy to blame one part of
the system when you have the whole system to look at.

The antenna can cause a fault with all of this. Any 1/4 wave antenna
tuned to provide 50 ohms of impedance at 27MHz, will produce a very
high impedance [+1000 ohms] at the 2nd harmonic, or 52MHz due to the
simple fact the antenna looks like a 1/2 wave end-fed at this
frequency and it's not impedance matched to any SWR meter designed to
read 50 ohms.

It's summation of the two SWR readings that are occuring at
the same time at two different [or more multiples of]
frequencies. One being the antennas own resonance at 27MHz
and again at those other harmonics. These are returning to
the meter and considering construction and gain at higher
RF levels at those higher frequencies, the wildly varying
SWR problem.

If you use the antenna with the radio - on it's own, and you can
verify that the antenna shows a low SWR using a stock radio, then
suspect the driving radio for the amp has a problem in it's network
and it needs to be fixed. The network is not providing consistent
results when audio is being applied - it's further amplified when the
Final/Driver pair is also changed to increase power.

Each transistor that you can throw in that output section has
it's own needs for providing the proper power it can produce
into the load the network allows it to see. They simply
respond differently. What may appear inductive to the network
using a 2078 - is highly capacitive using a 2312 or a 1969
type of final. The network responds accordingly - and offers

a very different impedance than the manufacturer designed.

You may be thinking - "Yeah right - the output is tuned for
27MHz so what is he talking about?"

Harmonic reduction and power levels - the final does change
it's impedance when audio and the subsequent bandwidth is
put into the carrier before it goes to the network.

It's the networks duty to allow the final to see a constant
impedance [less than 25 ohms] and allow the antenna to see
a consistent 50 ohms impedance.

If you change the network, or the component driving it, you
change the networks response.

Solution? Limit gain - put the limiter back in and reduce overall
"Swing" the radio produces - that small wattage increase is
effectively multiplied in the amplifier. The limiter [for audio] is
one of the bigger culprits - but limiting the overall output variance
reduces the SWR fluctuations to acceptable levels - an amp will live a
lot longer at an SWR of 2:1 than at 3:1 when you're shouting into the
mike.

>Please clarify these two points

Gosh! It's a long one, but I hope it helped get the point across that
it's too easy to blame the amp or the antenna, without looking at the
whole system and consider all the changes made to it to put in this
extra amp stage.

The best way I can put it is...

"Stop looking at the tree, and see the forest - to get the
condition the woods are in. Then chop down the right tree."

Greetings!

The Delta has outstanding audio - but when the RCI is cheaper, but no
echo, well - it's a give and take.

There's a lot of RCI's out there and not too many Deltas, and the fans
of both of them swear by them.

But then, I know of some people whom swear *AT* both of them too...;-)

On Fri, 7 Jul 2000 18:57:06 -0500, while the modem was pondering it's

I think you (Andy) missed it right off the bat. Unfortunately,
I don't have time to point it out in a point-by-point rebuttal.

Greetings!

No, I didn't miss it, it just hasn't been covered in this thread.

And it is a big problem when you have a system the customer doesn't
want to change, or budge on, easily.

It's too easy to blame the part added in, when the radio is merely
amplifying the problem that the amp is not designed to handle.

Er, excuse me, handles too easily, but not the way the
customer wants it done.

What's an "s" watt sine wave?

2 watts of audio will give you 100% modulation be it
vector math, spectrum analysis or oscilloscope analysis.

You're just plain wrong Doc--I don't know any other way
to put it.

------clipped--------

For the last time. No one is agruing about the importance of impedance matching, or how it relates to efficiency. The original question was for a simple way of determining if an output impedance was 50 ohms or not. I answered that in such a way as to give the 'best' test results using common equipment that most people might have. If you want to make that complicated, have at it. I am saying that your method of using efficiency is not accurate because of the number of other variables that affect efficiency. I don't have to 'prove' your efficiency method is inaccurate, most people, if they think about it, will decide that for them selves.
When did I say that impedance matching isn't important? That's the whole idea behind this thread in the first place! You really had to 'reach' for that one! The final test to see which is the 'better' method is to try both. Neither method will give 'laboratory-grade' results, but who cares, that kind of accuracy isn't required to start with. So if you want to continue in your 'efficiency' theory, 'knock your self out'. Just don't tout it as being simple, easy, or accurate.

No thanks Bill. I took this stuff when I
was in High school and the basics have
not changed. I'll will stick with what
works for me. By the looks of a few
other posts there are not in agreement
too. As a mater of fact no one seems to
agree here.... Hmmmm, wonder why!?????

What is it like to be right and the
whole world wrong?

I bet the original poster will never
come back here. He must be real confused
by now with all the fancy algebra and
graphs, when all he wanted was a simple
answer, and that is what I gave from my
old text book.

Have a good day,
John

I have not seen any specs. that have a variable power for this unit...My question is do I need a variable power option to put an amp on this radio? Or put in other terms is variable power a must have for boost with any radio? I have a 100 watt booster but I'm not gonna spend the money on this unit if it either won't work or I'm risking frying it....Lotta bucks to smoke it......Maybe I should just stick with the Galaxy......replies are appreciated.

Thanks
ROTTIE

What really causes bleed over, Is it the audio the carrier or the combination of the to? A few people have told me things like it's a cheap radio or the radio is between channels, it was a good radio and it was on channel. I guess what I want to know is, does a radio with a high carrier bleed over more or a radio with very high audio?

The transmitter has too much audio(more than 100%) or the receiver is to close and or the receiver does not have good adjacent channel rejection.Wayne

Source record: 43261

Hello David & Andy: Good reply Andy

Be advised that the Shakespeare ABS-1600 antennas had a problem from the factory. The SO-239 connector, the internal shield connection was crimped, and either came lose or had corrosion that caused a intermittent connection. But Shakespeare was replacing the bad ABS-1600 free of charge, and paying for the shipping. Good going Shakespeare!

I had one of these ABS-1600 antennas. It would receive ok, then the radio would go dead. By keying the radio would bring it back to life. But when keying the radio when the antenna wanted to be bad, had a terrible SWR.

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station.

In one word selfishness.

This occurs when an individual self proclaims himself as a technician
and believes that his practice of tuneing and modifying a radio is
justified even though this may bypass well established guidelines for
spectrally clean radio operation.

The tech is selfish because he doesn't give a damn as long as he gets
a buck. The operator is selfish because he doesn't give a damn as long
as he is not on the receiver side of his own transmission.

Not true.

>
> >
> > It only takes 2 watts of audio to fully modulate
> > a 4 watt carrier. Therefore, on a true average-
> > reading meter, the average output at 100% modulation
> > would be 6 watts.

True

> -
>
> Your example above is 50% modulation. 2/4 = .5 or 50%.

Not true. 2 watts of audio will 100% modulate a 4 watt carrier. It takes half the amount of power of the carrier in audio power for 100% modulation, and the carrier peak is 4 times the unmoulated carrier with 100% modulation.

> 'Doc

Good grief Doc, read up on amplitude modulation. Quoting from the Radio Amateur's Handbook, "The modulator must be capable of supplying to the modulated r.f. stage sine-wave audio power equal to 50 per cent of the d.c. plate input. For example, if the d.c. plate power input to the r.f. stage is 100 watts, the sine-wave audio power output of the modulator must be 50 watts."

From Elements of Radio, by Marcus, "To modulate a carrier 100 per cent with a single tone requires an audio-frequency power equal to one half of the radio-frequency carrier power."

The peaks of a 100 modulated carrier are 4 time the unmodulated value, the average power is 1.5 times the unmodulated value. This 50% increase in power comes from the modulator. This is assuming a sine-wave single-tone audio signal used for modulation.

If you check out e-bay, or even look at some of the for sale ad's on this newsgroup, you may find a decent condition Tram D201-A....its an old (25year old) tube type c.b. base unit, it has 40 channels, and can operate in the AM/USB/LSB modes. Its a wonderful sounding radio, and it likewise has plenty of AUDIO, (you WON'T be dissapointed) In my 26 some odd years of collecting, selling, fixing, and trading, radios, this IS the very BEST radio ive EVER heard on the air. I would say if you could find one in decent condition (NOT abused) for 350-400 dollars, it would serve you VERY WELL, for many years. Wish you luck in your venture. 73.....Frank....("The TRAM MAN")

assinine response, tnom. this same "bleedover" phenomenum occurs everywhere. Go on 14.250 mhz and there maybe some one talking a few kc's away that rips up your recieve. Did he have his hands in his radio? What about factory stock radios that have never been touched that accept bleedover and cause bleedover, Normally happens when people are to close to each other and the reciever gets overloaded, and yes from people running power etc but .. the answer lies in the recieve circuit not adequately filtering the signal. rci 2950's are notoriously bad for channel rejection

Can anyone tell me how modulators work? (add-ons) Do they raise the audio above the 5watt average?? Any schematics or the like? Thanks!!

Anyone considering the purchase of a Sony peripheral for their computer might want to give it some further thought. There clearly is not a reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad (won't read). When I called Sony service, I was told that I could not get a replacement and that I had to ship it across the country to be "repaired" (and we all know what that means...) - with a three (3) week turnaround. Assuming that they keep their 3-week commitment, with shipping both ways, I'd be without the use of the unit for at least five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an obligation to scale their service facilities to meet demand. To not do so is an indication of their lack of commitment to customer satisfaction and an unwillingness to stand behind their products.
-
Buyer be ware!

Not nearly to the extent it does with a marginal CB receiver trying to
put up with a marginally tuned CB transmitter worked on by a marginal
at best CB technician when operated by marginal practices.

> and there maybe some one talking a few kc's away that rips
>up your recieve.

I can be within 5kc's and not hear a thing as long as the transmitter
meets well established specs.

Normal bleed is acceptable when you realize just how piss poor a CB
receiver is. However the most common bleedover is caused by
ignorance.

At 10 KHz spacing, you should not hear the person on an adjacent channel unless they are within about a quarter mile.

I agree on the selfishness bit. The folks who bleed have heard the complaints, but continue to do it when a slight adjustment would solve the problem.

Hey Game, do the ones that bleed forty channels only do that because your radio is out of adjustment or because they are selfish?

I have a big load of radios, test equip, and parts to get rid of. I'm out of the CB fixing business, and I have to move. I just want to sell it all in a big lump. Here is roughly what is there, but there is too much to list.

Cobra 148gtl dx, Uniden pc122, Galaxy 99v (3watt xmit/low audio), solid state amp, wattmeters, d-104's, Uniden hr2600 (bad finals), Palomar vc-100 (works/needs case put back on), echo mike (needs cord), two frequency counters (one ramsey kit/not very sensitive 600mhz), 2 signal tracers, two solid state amps with new finals, big load of working mikes, big load of parts mikes, big load of parts radios, 3 parts drawer cabinets (new finals, displays, etc..), bunch of mobile antennas, several working am mobile rigs including a one hander type, and anything else I find as I clean up.

Email autoelectrical at hotmail dot com if interested. There is also a big load of car stereo stuff that can also be included.

Thanks to radio oger for use of his account.

Wow. I'll take a big whack with a 160 meter dipole. Yes, the math - I was considering integrating waveforms - AVERAGING - and yes, instantaneously, the thing will hit zero with 100% modulation. Actually, the unmodulated carrier will pass through zero, albeit 10 million times per second (on a 5 MHz carrier). AVERAGE power in the carrier WILL remain the same with modulation - BUT - INSTANTANEOUS power will vary.

If it makes you feel better, I felt terrible the next day. Not the post, which was bad enough, but I sent the thing right after a party - Ohhhhh ...

Please accept my apology,

Jim, AA2QA

> ^^Old 1200 in the mobile around Chicago^^

Gunsmoke,
'Bleedover' can be caused by a numebr of different things, usually
audio connected. a radio signal's width is determined primarily by the
audio range from the microphone. If you use a mic with very broad
frequency response (eg:studio mic), your signal will be as wide as the
frequency reponse of the mic, barring any audio tailoring. A mic used
for music or other hi-fidelity recording has a very broad (>3000cycles)
audio response. Communications microphones have a narrower response
range, usually around 3000 cycles. They don't sound good when used to
record music. On AM, add the frequency response to the carrier
frequency
and you get the approximate bandwidth of the signal. If the frequency
response is 3000 cycles, then double it, and that's how wide the signal
is (6k = normal for AM signal).
All the above assumes that the signal is less than 100% modulated!
A signal that is over 100% modulated is even wider. I can't cite any
'numbers' for how much wider it makes the signal, but it's certainly
very noticeable!
Now you come to if the radio has been 'diddle-sticked' or not. If
you know what your doing, there can be some improvement by 'tweaking'
a radio. But it's very easy to go too far with it! If someone has
'over-done' the 'tweaking', you can't imagine how 'dirty' it can get!
Power has really very little to do with 'blead over' or splatter.
It can certainly cause a signal to be wider than it should be, but it
isn't the primary cause of bleed-over or splatter. And that assumes
that the amplifier isn't over-driven which also contributes to noise.
I'll bet that's more than you ever wanted to know about the
subject, huh?
'Doc

> 'Doc"
>
> Is what you said, reread your ignorant quote again,

Your right, I didn't make that very clear did I. Should have
said that checking the SWR of the amplifier, working into a dummy
load, will show if the output impedance of the amplifier is 50 ohms
or not. If you get the same SWR as the radio did, it's 50 ohms, if
you don't get the same SWR reading, you know the output of the
amplifier is not 50 ohms. Assuming of course, that the radio has
a 50 ohm output to start with.
As far as Bird meters, the common variety (43) does not read out
SWR, as you know. I've never seen on of the digitals so have no
idea if they do or not. So, you can't read SWR with a Bird 43, can
you, you have to calculate it. And how many average CB'ers do you
know who do that? As far as that goes, how many average CB'ers do
you know who own a Bird watt meter?

>

Several years ago before I regained my senses, I use to sell CB radios. It wasn't my primary buiesness, but it being a hobby of mine, I thought it fit in well in the hobby and collectable store we had at that time.
I would often take a customers radios home in the evenings to work out the bugs, you know, to just check them out. So I had the opportunity to use many different types radios .New, used, vintage, almost any type you could imagine.
Now to add to this, I had several guys in town who ran CB's that I knew well. One was 2 blocks away, another about 10 blocks from me. Another almost 3 miles away, another 7 miles away and lastly my little brother 9 miles away.
What did I learn? Cheaper radios do have poorer rejection compaired to more expensive radios. A President Washington had much less rejection than a Cobra 2000.
It wasn't uncommon for my little brother to bleed me 5 channels or more on a Robyn 520D or President Washington, but my closest neighbor would only scratch a few channels on a Cobra 2000, or even a Galaxy SSB Echo (pre Saturn) . My nearest neighbor made it a point to purposely bleed me as often as possible, by useing amps, power mic's, ect. On my own personal radio, the best he could do was scratch a few channels. But on some others he would render them useless.
So to sum it up, although the above statement by tnom@mucks has some minor merit, it is by the most part the quality of radio that you use that determines that amount of bleed over you receive. Mr. Mucks statement might lead some of you to beleave, as most do, that the person who is bleeding you is running a illegal, or poorly tuned radio. This is simply not always true and is exactly the type of attitude that causes all the hate and discontent we hear so often on the radio. Its funny he mention selfishness, because his bias and some what misinformed statement is a clear example of selfishness. Bleed over is a fact of life we all have to put up with. If you don't like it, work on up gradeing your equipment, or get out of the radio buisness. Its that simple.

1218. adding second transistor to radio

Newsgroup: rec.radio.cb

I want to add a second transistor to my old radio . its a TRC 47 old 23 but i like it.
The texas ranger has an extra location for an additional 2sc2312. I was wondering if someone had a schematic of this radio . it would be helpful to me in adding a second transistor to my own. I just want to know how this extra transistor is hooked up. base , collector , emitter connections.
thanks for reading my post.

Let me guess . You have a neighbor who bleeds you, and if only he would run legal, you would enjoy your hobby so much more.
Maybe the FCC should make a new rule. If you bleed some one, you loose your radio. Sooner or later there would no longer be bleed over, because no one would be left to do so.

God damn it, why wont the bugger work?

Righty, I have my mobile CB set up in my car, with the antenna connected as it should be (according to many posts here) and I get the following problem when testing it with the SWR.

All channels have the following reading:

FWD - 3.5 with calibration turned to max
REF - wayyyyyy of the scale, needle nearly snaps if you're not quick enough to let go of transmit!

With 10db ATT button off, get virtually no reading FWD and about 2 on REF. I sense a problem! :0)

Tried to alter antenna, no change so I presume it is something more fundamental (and costly probably!).

Please help me quick, I have a week to get it sorted, before I go on holiday. It's an old FM Amstrad CB 901 (See www.j.buckle.btinternet.co.uk/image1.jpg) and the antenna I'm using is this one (www.j.buckle.btinternet.co.uk/image2.jpg) The antenna earth has been connected to ground very well (the neg lead) and it makes no difference. I can hear people, not too clearly but OK. Have had some very clear signals but there is no way I can get out.

Someone must know where I am going wrong..... I think.....I hope!

Please send me an email QUICK if you know what's up! Also, how much would a UK CB shop type of place charge to check it out?

Muchos thanks,
James + Ema

Well you need the extra channels to get on the triple nickel (27.5550). I usually hear the european operators on the extra channels. There are some people on the 26-27 band cannot understand most of them due to the distortion they are producing with their screaming and over modulated rigs. Basically the radio goes from 26-28.

No I have neighbors who can give me 60db over nine yet I can't hear
them 5 kc's away. And then I have idiots that give me as low as 9
s-units but I can hear them 10 channels away.

This is normally the case along with piss poor receivers. as I said.

Ignorant people do accept bleedover as normal. The more informed
understand when it is normal and when it is the product of selfishness
or ignorance.

So just how can a capacitor cure bleedover caused by a misadjusted, overmodulated transmitter? I guess if you connected from the output of the transmitter to ground so it grounded the signal, that might cure it.

And what would that adjustment be?

>
> Hey Game, do the ones that bleed forty channels only do that
> because your radio is out of adjustment or because they are
> selfish?
==========
probably because they are to close to your 20 would be a major reason, Your radio doesnt need to be out of adjustment to accept bleedover. Nor does the other person radio need to be out of adjustment to cause bleedover. Nor does it have to have been peaked or clipped to cause bleedover the original posters question was if it was a big carrier or the audio which causes bleedover I don't think he wanted to know how many pounds of selfishness your hitting him with cause you had your radio peaked he like the rest I am sure know that running power will cause excess bleedover, close proximity causes excess bleedover, cheap built radios with poor rejection etc will accept more bleedover. So your saying a truck driver passing thru the neighborhood who bleeds you while he rolls in is selfish even if he is using a stock radio? If you talk on a cb you bleed someone, I guess were all selfish in a way...

you got that right blutarksi, just put that radio in the trash
compactor and push the button, then no more bleedover and your
neighbors will love you even more that they do now,......cd is out...

#61,

Are you one of those bitter Canadians? I sure hope not... I have met FAR too many of them. I love your country, I love to visit there, and in the process I spend plenty of US dollars there. Lately so many Canadians seem bitter about the exchange rate that Im starting to think Im better off forgetting that the GREAT country of Canada even exists (like 99% of the rest of Americans) and spend my vacations and money at home! Why are you guys so bitter??

Dave

I am not bitter just stating fact. The exchange rate only effects people that travel to the US. I was making the statements in a tongue and cheek manner. Sorry you took it wrong. I for one could care less about the exchange rate. There are bitter people living in all countries but I am certainly not one of them. If I was living in the US I would come to Canada and defiantly take advantage of the exchange rate.

The low Canadian dollar actually benefits our country. If you follow business you will see US companies choosing Canada over their own country to build plants due to the exchange rate. Our exports are incredibly high to the US because of a low Canadian dollar and businesses here wouldn't have it any other way!

Do you get to talk to alot of Canadians? If you rather stay at home that is your choice. We certainly are not hurting for business when it comes to tourism. You should see the bus loads of tourists coming to Toronto in the summer! I get to talk to many americans and find that there are some assholes and some nice people just like anywhere else.

See you later!!

Barry D.

sound like the coax is shorting out
take an ohm meter disconect coax from radio take the ohm meter put one lead to the casing and the other lead to the center of coax if the neddle moves then the coax is shorted some where braid touching the center conducter enjoy jose

Im glad you aren't one of those bitter ones! Yes I do have friends in Canada that I talk to regularly, and I AM aware that the strength of the US dollar benefits Canada. I do business daily with several businesses in Ontario. I love your country, and most of the people Ive met from there are great folks. I just get REALLY pissed when people that benefit from MY DOLLAR are bitter about the exchange rate! Like I said... Im glad that you are not a bitter Canadian... next time Im up that way we will have to drinks some REAL LaBatts and smoke some Cuban cigars... neither of which are available in the US!

Dave
Honorary Canadian, and Ive got the CDN bumper sticker to prove it!

> 'Doc
==========
If you want to mince words no it doesnt Say this is the swr" unless you get the one that has the microproccesor in it but it does give accurate swr readings, Again yes you can read swr with a Bird 43 Who cares if you have to calculate, they have slide rules that do this for you and after using it a few times you know that 100 forward/ 4 watts reflect is a 1:1.5, just as well that 10 forward + 3/4 reflect are the same , as well as 50 forward and 2 reflect is a 1:1.5 all ratios not rocket science. all the while it still is giving you the "Correct" readings ...ahh hello what is the swr ratio comprised of forward power and reflect power.. both of which you get from a bird .
Not sure how many average cber's i know but i would say the group of cbers i do know all own Bird type meters and they actually use 2 meters and the dual line section which allows simultaneous readings of forward and reflect power. The problem most people have using conventional swr meters is that they dont recalibrate after they cut the amp on .

Really you're probably right... there is no amp that is 100% stable at all
load angles. I probably should have said "good stability"... and then you
incorporate the feedback to gain level.

That's not what you said before...
But I'm glad you realize that impedance matching does have to do with
overall efficiency.

Sorry... I can't agree
Those transistors in the 2pill section are not rated for for that wattage input. They may take it for a while but that is certainly a recipe for destruction of the amp. You would be incredibly deep into what is known as the "compression" area of the transistors.

Sounds to me like you have forward and relected mixed up. Are you paying attention to the input and output of the meter?... or... could the switch in the meter be hooked up backwards?

CoyoteBoy,
Before making anymore changes, you might check the calibration of
your SWR meter. I may be misunderstanding the procedure you stated,
but it didn't sound right. Before doing something irreversible, check
the SWR meter.

Len, first are you talking about the so-called modulator kits that are connected internally to the radio?? Or are you referring to the RF type unit that connect to the radio externally??

All I can say is that you don't hang around with average CB'ers.
Anyone who owns more than one Bird is just not your average CB'er, most
don't have the first one!
I'm not saying you can't calculate SWR from a forward/reverse watt
meter, of course you can. But to make the test as easy as possible, I
said to use an SWR meter which most people have. And since SWR is by
definition, a description of impedance relationships, it sure seems
like the meter to use.
It isn't me who is mincing words, or nit-picking, or trying to make
things more difficult than it has to be. The original question is still
the same, "how to tell if the amplifier output is 50 ohms or not". The
test I described will do that. If you have a problem in understanding
why, then that's your problem. If you want to 'pick' at it, be my
guest. But
the test works, it answers the question, and all the rest of this is
bull shit. What does that make you?

Has the radio been tuned? What is the dead key output? What is the booster you speak of? Typically the 79-290 when tuned will key around 7 watts swing to about 28 watts. the 7 watts would be high for most amps. If you are going to run the amp all the time then have the dead key (carrier) turned down on the radio. 2-3 watts would be good. If you aren't going to run the amp always then you may want to have the amp modified for a high drive so it will take the 7 plus watt dead key.

1264. Popular Communications, Aug 2000, Pg 64, well worth reading

Newsgroup: rec.radio.cb
Date: 2000-07-08 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <3967C50B.233CE759@qnet.com>
Source record: 43394

Hello All: Pop Comm August 2000 issue, Page 64.

The article is written by Jock Elliott SSB-734

Its header is "ARRL's Silly Comments". This article talks about the FCC rule that makes talking to CB stations more than 155.3 miles, unlawful.

I won't spoil it for the rest, but I love to hear the typical ham radio type of guys reciting rules while being totally oblivious to what is going on, and being NOT street smart as to whats really happening.

The magazine Popular Communications is well worth the price of admission.

Oh yeah one more thing, the article header also says "And Cobra's Exellent 148 NM ST". The new Cobra's have a face plate, that is illuminated. I am ah buying one!

Jay in the Great Mojave Desert, ... just down the road ah way from the fillin station.

SSB-1373 Marine Mobile, 1968 to 1970.

In Canada your CB is welcome (I travel in an RV with both a CB and HAM Radio). You do not need any licenses (all is recip) but do leave the high power/modified/amp stuff at home. CAVEAT: Possession of a Transmitter Device which you do not a license or permit can cause hassles-example-10 mtr modified radio with no ham license! FRS radios are not permitted. Radar Detectors are verboten in the Provinces of Ontario and Manitoba and the local gendarmarie will not hesitate to confiscate one if found. Was stopped on the 401 (Queen's Highway) outside Toronto, Ontario some years back because I had a 2 meter rig mounted on the dash (I was neophyte and didn't know any better) along with the aditional CB, Ham antennas. OPP (Ontario Provincial Police) checked out my radio since they thought they had "captured" another radar detector but they did ask for my Amateur License, Car papers and all that good humbug to see if anything was amiss. They called in my callsign and when it checked out, i was free to go. The Officers in Canada are very friendly but they are thorough about their mission.

Again, no problems about using a stock CB in Canada, the border is almost invisible to CBers and Hams.

The Model 43 THRULINE ® Directional Wattmeter accurately measures forward or reflected power in coaxial transmission lines under any load condition. Each Model
43 consists of a line section, "QC" (Quick Change) connectors and an indication
meter housed in a rugged, corrosion-resistant aluminum case.
The line section is a high-precision 50-ohm coaxial air line that inserts between
the transmitter and the antenna or load. A socket is provided in each line section
for a plug-in element with the desired power rating and frequency range.

THRULINE RF DIRECTIONAL WATTMETERS

The ruggedly built, multifunction Model 4391A RF POWER ANALYST ® features a digital display, microprocessor-based operation, and simplified, push-button control.
This wattmeter is well suited to C 3 , telemetry, two-way communications, avionics
and radar, as well as standard radio and television applications.
n Frequency: 0.45 to 2700 MHz. Power: 100 mW to 10 kW
with 20% over-range.
Reads forward and reflected CW or FM power in watts or dBm,
Peak Envelope Power of SSB/DSB and symmetrical AM in watts,
and peak power for pulses as narrow as 0.8 ®s.
Calculates SWR, return loss in dB and % modulation
Stores peak and null readings to facilitate adjustment
of maximum and minimum signal levels.
Shock-resistant keyboard and range switches. RFI protection.
Built-in international power supply/charger.
Model: 4391A
Power Range: 100 mW to 10 kW using
Bird Plug-in Elements*
Frequency Range: 450 kHz to 2.7 GHz
Insertion VSWR: with N Connectors

1.05 max. to 1000 MHz
Accuracy: Power Readings: ?5% of full scale CW, ?8% PEP; VSWR: ?10% of reading % Modulation: (CW power 1 ? 3 or more of full scale) ?5% (0-90%), ?10% (90-100%)

>>
It clips the modulation peaks which does not contribute very much to the overall signal and boost the lower and middle parts of the signal. This make you sound louder. It also generates splatter and if not used with dicretion makes you actually sound worse.

1271. Re: SWR on base station

Newsgroup: rec.radio.cb

First thing is to hook up a dummy load in place of the antenna inside the house. If the SWR goes to 1:1 then the problem is outside. Next put the dummy load up in place of the antenna. If the SWR is 1:1 then you have an antenna problem. If not it is a feedline problem.

What he is discribing is a 1/4 wl antenna with a capacitor in series with the radiator. This used to be a fairly common thing to do for 10 meters on mobiles. With the cap you could use a longer radiator and theoretically get a little more gain. What was eventually discovered is that the cap added as much or more loss as the longer antenna did gain. This did raise the feedpoint impedance of the antenna a little giving a better match to 50 ohm coax. I've always thought this probably came about through the availability of military whips that were available after WW2. They were about 15 or 16 ft long and a coil could be added to resonate them on the lower bands or a cap put in to make them work on the hgher bands. William Orr discribes doing this in his older books but has dropped it in his newer editions.

You really can't check input impedance with just an SWR meter either. Lets say you measure an SWR of 2:1 on the input. It could be 25 or 100 ohms resistive or any number of other complex impedances. The time honored way of actualy measuring it is to correct the impedance to 50 ohms then see what you had to do to correct it. There are impedance measuring devices that have calibrated inductors and capacitors for doing this. However it really is not practical to measure it. Once you know the values to make the match your job is done. The actual input impedance is now purely academic

SWR is an indication of impedance relationships as long as you are talking about the load and the line. Actual SWR has nothing to do with output impedance of the amp. There is the possibility that output impedance of the amp may affect the reading but I have never seen what this relationship is or even if there is in fact one. It is something I have been trying to find the time for the last year to determine. Just can't seem to get a round tuit. You may not really need two SWR meters as I discribed, to make the test but I assumed ther was a possibility that the impedance of the source could effect the reading and chose to elliminate this possibility by calibrating the output of the RF test source to a known 50 ohms.

1278. Re: (Bleed over)

Source record: 43158

What you are most likely experiencing is RF Front End Overload. All CB radios that
I know of have a wide broadbanded RF amp stage as their Front End. The broadbandedness
of this very first RF amp stage amplifies every CB frequency from channel 1 to 40 no matter
what channel you are listening on. If you are listening on channel 30 for example, and your
neighbor a few blocks or houses away keys up on channel 15, the 1st RF amp stage of your
front end will amplify his channel 15 signal along with all the other channel freqs being received
from your antenna. If his signal is so strong as to "swamp" your RF amplifier stage (causing it to
go into clipping) then your receive on channel 30 (and all the other channels for that matter) will
be wiped out at those times. That's just the way it works. From the cheapest CB receivers to
the best CB receiver sections (including the Cobra 2000). Same goes for the 10 meter rigs.
They all have a wide open broadbanded RF amplifier as the first stage in their front ends.
This by the way is not "Bleed Over". This is Front End Overload.

Bleed over is when the other station is generating spurious or harmonic frequencies other than
the channel they are transmitting on. The harmonics or spurious frequencies are what you hear
on another channel as "splash" or "bleed-over". Causes of this are mostly due to someone
overmodulating (turning up their power mics way too loud) and they will sound fuzzy and distorted.
(Most CB'ers don't even know when they are overmodulating from my experience). When you
overmodulate an AM carrier, it clips and the sharp clipping waveform you see on an O-scope
causes alot of spurious unwanted harmonics to be generated. These harmonics are what you hear
as splash or bleed interference on the other channels.

Dirty transmitters are another cause for bleed over. When someone sticks their fingers into the
cookie jar and messes with the bandpass filters (coils and caps) they could mistune them so that
the undesired harmonic interference frequencies will pass through and be

transmitted with higher
than normal amplitudes causing interference to other frequencies including TVI.

Anyhow, you probably have nothing wrong with your radio. It is probably normal.

Unit 824, out.

I have noticed radios with the older style 858 chip are more susceptible to receiveing what you call clipping (over modulation) and bleed over compaired to some of the newer chips. 520 d's were popular back in my day. They were unbearable at times to use in town, because of bleed over and or clipping, but other radios such as Cobra 2000's experienced very few problens. I'm not saying the 2000 didn't receive bleed over, but it was much less.
I do not disagree with your statement, but I do take issue again to your reference to dirty transmitters, power mics, sticky fingers, which many beleave is the so reason for bleed over. I do think it is safe to say all radios cause , and receive bleed over, and as you call it clipping. I also beleave it is safe to say some radios are better than others as far as rejecting bleed over. It is normal and sould be expected to receive bleed over.

Yeah I know. Smart enough to run good equipment and suggest that
others do the same. Otherwise they or you, if the shoe fits, can go on
believing that most bleedover is normal. It is not.

Bill Eitner <kd6tas@freewwweb.com> wrote:
: I'm glad you didn't get sucked into agreeing with an aggressive
: explanation.

: There are four good reasons why the SWR will change with
: increased output power: non-linear devices in the SWR meter;

Negated by the level adjustment in the SWR meter.

: instability in the amp; antenna breakdown; and, an impedance
: mismatch.

Amp instability could change the harmonic content - so the indicated
SWR could change. You are also correct about an antenna breakdown.

However, a change in the impedance of the output of the amplifier (what
this whole discussion is about) will NOT affect the SWR reading.

Not if Dave or Debby has anything to do with it!

Ah well, yes that Pop Comm article was really cool and the answers were predictable. Oh, why is the ARRL called the American Radio Relay League when all they care about is mostly amateur radio? Hell, the A is already there, why not just make it the Amateur Radio Relay League. There the only ones the ARRL helps out.....

Try hooking it up right. From your description, you have the radio
hooked up to the antenna input and the antenna hooked up to the radio
input.

Ron, RF parts is a great company, they've been in business lots of years, they have a solid reputation, i don't know where you would get them any cheaper except perhaps Westgate Labs, which has been in business for at least 10 years.... other than those two places I don't know anywhere reasonable... I think most places buy from them in quanity and mark up from there....

Greetings!

What you ask is pretty much the answer to your question. There are a lot of Hi-Po miracle radios out there - and those techs that stand behind them - as in standing behind the owner when things go their way, but vaporize and vanish when it doesn't.

A radio with strong audio - wins the battle of the bleedover game every time - simply because of the splatter. It goes thru all the channels. If you're far away enough - the ambient air noise will mask it out. I pity you if you're located close to that station.

A radio with a strong carrier but clean audio - if they're close, causes a separate problem that is related to bleed over. It's the receiver trying to remove or reject the strong signal - it can kill the receivers sensitivity by forcing the receiving radios AGC to shut down the RF amp and IF amp sections of the radio as it tries to pull in only what the receiver should be hearing on the channel not the other channel where the interference is. Your radio, being the victim - blanks out and you are left with [#$%@@!!?!!!] being heard instead.

Sure we can get to the higher, finer points - I have that for you at the bottom of this message. It's easier to save yourself from those around you that have no clue whatsoever on how to undo what they did. Let the Police/apartment/condo associations take care of them - you should really ignore that ignorant stations' own efforts at spread-spectrum broadcasting. ;-)

Well, you really can't do anything 'bout another station wanting to screw things up and make it tough on everyone else around him, but there's some stuff you might want to know and can use for later if this problem keeps cropping up...

Bleedover, can be caused by a *very* strong carrier and powerful audio - both can be accomplished by driving up to the guys driveway and asking for a radio check on channel 19 when you're really funnin' him by being on channel 20.

Thats bleedover...in the basics.

But, for your own protection, and perhaps you can use it in a roundtable discussion over a few cups of coffee, ask your friends if they know the frequencies of the IF's in their radio.

There are two ceramic filters in any typical CB radio. One is based on 10.700 or 10.75 and is the first IF stage. The part looks like a little capacitor with three legs in a row on it. This part takes the

RF after it's mixed with the PLL [as I call it] IF and makes the signal you want to hear - selectively passed thru this filter.

It's then amplified and coupled to another filter, using what looks like a little square or rectanglular component - that can have two numbers on it. 55 or 50 - meaning the 2-nd IF being 455 KHz bandpass and the 50 number means the part passes 450KHz at it's peak resonance.

Between the two stages, and how they are put together, can make or break the radio as far as selectivity and rejection are concerned.

The little black square, can have multiple poles for greater selectivity and narrower bandpass filtering - meaning that the radio that uses this part having more poles to pass the signal thru - has a better chance of removing someones noisy bleedover than radios that don't use those extra poles to clean up the mess.

You can also change the resistors in this section to tailor your needs. The 455KHz 2nd IF filter section can really work well in getting those stations out of your box - if you make the proper changes.

By messing around with these two sections, you can take a cheap piece of [carp] and make the radio work like the more expensive types.

Any tech worth their salts can figure this one out and make the appropriate changes to your radio if this is a big problem.

On Sat, 8 Jul 2000 08:23:46 -0500, while the modem was pondering it's navel, "Gunsmoke" <rich@hotmail.com> dissertated the following:

This piece of crap has been attempting to block our (New Zealand) SSB calling channel for months now with abuse, foul language, drivel and I think it is about time we tracked him down so we can offer some support and *encouragement* to see the light and show some consideration to the legitimate operators using the frequency.
You will know who it is without any further information if you ever flick down our way when the skip is running.

I would appreciate any help in locating this miscreant.

I have a meter, 2 connectors. One has TXMTR and the other has ANT. I connect the TXMTR to the transmitter, the other to the Antenna. I set it to FWD, transmit and set the clibration knob so that the needle reads SET. I then flick to REF and read off, is this right? It's what a book I borrowed said.

Anyone clue me up on this?

Just for the record, the antenna has a good earth and there is no short on the coax. Internally however, the centre is connected to the outer via a small coil of wire and a capacitor. Is this OK?

Many thanks for the replies alred arrived, keep em coming !!!!

Make sure your antennat is not to close to anthing metal and also check to see if you have a good ground to the vehicle. If your running a mag mount antenna make sure it is on top of the vehicle or at lest toward the center of the trunk away from the roof of the car.

It he is talking about a grounding grid
for a tower, it is well known that 4 or
more ~10 foot radials of #4 or bigger
wire terminated with a ground rod does
improve wave propagation. How much
depends on the conductivity of the
ground, tower height and lobe pattern of
the antenna.

If that IS the case that is the basis
for a noise filter. I have posted a
design of noise filter for power feed
lines before on here and has been
successful in reducing 95% of audio
noise and RF protection for the
vehicle's computer system. It is a
simple L/C circuit.
Cheers,
John

Well... you do seem to be doing it right. You therefor must have a severe problem with your coax/antenna. Do you receive any incoming signals and static on your set when you hook the antenna? I'm trying to determine the integrity of the center conductor in your coax...

1303. Re: HELLPPPPP!!! URGENT!

Newsgroup: rec.radio.cb
Date: 2000-07-09 00:00:00 UTC
From: Professor <bgriffey@kwom.com>
Message-ID: <iGY95.10790$L8.40025@east3.usenetserver.com>
Source record: 43183

This is good advice.
I see many people operating mobile antennas in close proximity with the
vehicle body. Antennas mounted on a bumper of van are escially bad!
Depending on how close... and the amount of antenna near the vehicle body...
you can get severe mismatch problems and greatly impact the antennas
radiation pattern. And incidently... you'll be getting out just awful.

Wrong!! FRS is permitted in Canada. I wouldn't worry about your amp nobody is looking for them. Lots of truckers cross the border with them and never get caught. I agree about the radar detector. Just turn it off and put in your trunk.

They called in your call sign? LOL! The people who deal with amateur radio licenses are Industry Canada. The OPP would have no way of checking for an amateur license especially an american one!! The police in ontario could care less about radio equipment. Sounds like Martin is in lala land.

From: dbb
Message-ID: <jhqgmssbrnanfdeurns37uv204480mtcuo@4ax.com>
Source record: 43188

I have a 6 ft Anttron 1700 mounted just in front of the sunroof on my 96 Explorer. I use a combo stud mount/quick disconnect, swivel (the roof slopes forward a bit and this gets the antenna vertical), and 90 degree fold-down adapter (all available from Firestik). Before pulling into my garage I just open the sunroof a few inches (it's electric and slides back), reach up and fold the antenna down so it rests on the luggage rack.

On Thu, 06 Jul 2000 01:19:17 GMT, "Meg Staples" <mastapes@ptd.net> wrotf:

>what kind of antenna can i put on my 97 ford explorer? i park in a garage

>I guess what I want to know is, does a radio with a high carrier
>bleed over more or a radio with very high audio?

You have received many responses to your querry about bleedover. Im not going to get technical over the issue because bleedover on the c.b. band will FOREVER exist, as long as people continue to run high power amplifiers. BUT if you have axcess to any websites that have specs to older type radios......(Tram D201's or D201-A's) you will clearly see that the Tram and Browning radios were among the VERY BEST in adjacent channel rejection figure's. If this is an on-going problem, I suggest that you find yourself a good old vintage radio.....like the 3 I mentioned. Its not going to eliminate the bleedover problem, but it sure as hell will make it a LOT LESS of a annoyance to you.Ive experienced at least the 75%db rating of adjacent channel rejection with ALL my Trams, good luck with your problem.....73, Frank.

1310. INFO NEEDED ON A MIDLAND MOBILE 13-892**********

Hello all, Ive just recently got my hands on a very good Midland mobile radio, its a 23 channel AM/USB/LSB model # 13-892, the info I need is how do I mod this 23 channel rig into a 40 channel radio? I cant seem to find any information in my archives on this topic. If anyone out here has experience with this fine performing radio, please contact me at your leasure, and thanks in advance.....73.....Frank.

Source record: 43192

QST--

You are invited to join one or all of the following lists on e-groups(formerly onelist). All these reflectors are e-mail based, friendly, objective, and moderated ,so that no spam, porn, off-topic, or personal-offensive posts are sent out. You will receive no off-list e-mails by subscribing: again; no spam.

These lists (with average recent subscriber sizes) are:

ANTENNAS@EGROUPS.COM 180 members
CROSSFIELDANTENNA@EGROUPS.COM 67 members
FRACTALANTENNA@EGROUPS.COM 265 members

Please review the descriptions at:

http://www.egroups.com

Please note the CFA list specifically deals with this antenna in an objectively critical fashion and no posts will be allowed that make grandiose claims without supporting data presented. To date, no data has been presented which requires the extraordinary claims made by some pundits: there is no evidence for better performance than any other small vertical antenna (and that performance is poor).

To subscribe to any list, either go through the process at egroups, or to skip the process (and some say 'annoying questions') just do:

---------- -subscribe@egroups.com

where the ---------- is the name of a given list (such as 'fractalantenna')

If you have a specific question on this post, please e-mail me off-NG at chipn1ir@aol.com.

73,
Chip N1IR

Save the time and trouble and just pick up a small modulator or 1 pill- 2 pill amp and be done with it. This will also allow for added output on any other radio you may want to put in the system in the future.

correct Bill, if that were true that would mean everytime hooked up a
different amp with a different output impedance you would have to retune
your antenna since now your swr is different ...

Not Lala Land, but ONTARIO. You see, a ham can be checked out on the
Police
Computer System (Ncis in the states) and the Compact between the
individual
states, provinces and both Federal Governments allow for quick cross
border
checks and yes the OPP is THAT efficient! Last summer I crossed at
Sweetwater, MT/Coutts, AL and was singled out for a weapons search
(being from the Southern USA

was a tipoff according to the Revenue Canada Custom's officer) my radios did come under
close scrutiny but the Amateur License was checked (AGAIN). After the search, the
male inspector, Todd, showed me what the criteria is for certain items and yes they do have some idea about radios but not all that clear (best idea, don't have a problem, don't carry what ain't allowed). Most police, in the USA and Canada don't care
about radios, they will show some curosity if you have something unusual or not
generally seen type stuff. Barry, curosity is the hallmark of a good cop and unusual or
odd stuff will spark interest, Radar Detectors in Ontario, especially anything mounted on the dash sparks curosity, I satisfied the officer's curosity that it wasn't a
radar detector or police transmitter, learned how the radar detector-dectector functioned in his vehicle, quite interesting.

Because I believe that it is not normal with good TX and RX equipment
to receive bleedover from anyone farther away than a 1/4 mile. I have
routinely operated around this 1/4 mile radius without bleedover and
it should be considered normal to not get trashed from anything
outside this area.

Most all stations I hear are OUTSIDE a 1/4 mile radius so I should
expect most stations to not bleed over.

Source record: 43222

The older 858 PLL based CB radios were and still are nice radios. True they are not as good in the receive selectivity department as the Cobra 2000 or the 148 GTL
or Uniden Grant XL and LT radios. That is because the old Robyn 520D and President Washington 858 PLL based rigs had a "lesser" receiver than the newer Cobra 2000 and Uniden Grant XL/LT rigs.

They used only single conversion receivers and lesser IF stage filtering. The newer Uniden
Grant XL/XT and Cobra 2000/148 GTL uses double conversion receivers and better crystal
filtering Thus they are more selective. You hear less off frequency hash and noise than you would
on the older, simpler and lesser receiver designs.

What also makes a big difference on these two genre' of radios is that the Noise Blanker circuit
is better designed and improved over the older 858 PLL radios of yesterday.

BTW, receiver performance has nothing to do with whether it is a 858 PLL chip vs the MB8719 PLL chip
radio. It has to do only with the RF front end and IF filtering and the Noise Blanker circuit design.
The 859 PLL chip only generates the frequencies to operate on.

And sure, any radio TX can cause Front End Overload bleed over if they are very close in proximity to
the receiver. Cranking up the audio louder than it has to be is the number one culprit of distortion and
splatter from what I have experienced (as in OVER modulated). After 100% modulation you cannot
get any louder on AM, just more distorted and less inteligible. But alot of people doing it, don't
understand that and turn it way up thinking that their audio is blasting in (or out?) to everyone when it
fact it is hard to understand them due to all the fuzzy, muffled distortion. Yes they will still be loud, but
loud and distorted and noisey. 100% modulation will be loud and cystal clear and you don't need
to go beyond that to be louder. It will only become more distorted and less inteligible to the
ones who have to listen to it.

Unit 824 in NYC, is back out.

Martin this is the last time I going to continue with this thread. I happen to have an OPP officer in my family. I just talked to him and asked about your claim. The OPP care less about CB radios, Ham radios except in the case where a crime has been commited. An
OPP officer pulling you over has no way of directly checking the validity of your Ham Ticket. Nor does the OPP have the authority to check amateur licences. That is taken care of by Industry Canada. The officer would have to have a dispatcher call the proper authorities at Industry Canada who would in turn pass on the info. They just aren't going to do it.

What Revenue Canada does is if you are asked to stop for a formal inspection and you are re-entering Canada they might ask you for your green declaration card. Once again Revenue Canada doesn't have the authority to check for amateur licences. If you are an American entering Canada, customs could not give a rats ass about radio gear unless you are planning to leave it in the country ask any trucker.

If you think enforement of Amateur Radio Reulations is slack in the US it is non-exsistant in Canada except for very rare cases. The only way the OPP would get involved is if you hit someone over the head with a radio and you happen to be in their patrol areas.

I forgot to mention that I have a President Washington older version based on
the
858 PLL) and it is basically the same rig as the Robyn 520D that you mention.
While the receive section is inferior to the later design of the Cobra 2000 base
station, the transmit section blows smoke rings all over the Cobra 2000, 148 GTL
and Uniden Grant XL/LT models. Also even though I agree with you that the
receive
sections of the older radios (Robyn SB520D, President Washington, Radio Shack
TRC-458)
are not the best, they are still indeed adequate enough for most situations. I
live in
crowded NYC and I get alot strong station interference at times. The Old
President Washington
rig is not much worse than my Uniden Grant LT on getting splattered. Although
its
Noise Blanker circuitry is much worse than the Uniden Grant LT. The transmit
audio
section has superior modulation and sound quality than either Cobra 2000 or
Grant LT
though! So these radios are classic keepers for collectors and users alike
IMHO.
I use an old Turner +2 base mic or a newer Sadelta EchoMaster Plus mic and the
audio
is superb! Albeit the Cobra 2000's audio is nice too, but the older 858 PLL
based rigs
are capable of even better TX audio. Too bad they changed the designs of the
mic amp and
balanced modulators sections in the newer Uniden PC boards!

Unit 824, NYC outta here.

Main point is/was Officer Friendly was looking for a radar detector due

to the fact I had a small radio mounted with velcro on my dash, his wanting to check it out was anoather thing, I learned never, ever, argue with the dude with the badge, just comply, they got enough problems as it is. What was the original stop? The radio was in plain sight, looked like a Radar detector and I had Louisiana Plates. enough on this thread, as you are right, very little enforcement unless you hit them over the head, that is everywhere.

well i don't know if he is serious or not ice cold but you have to admit it is kind of silly for someone who happens to be of the caucasion persuasion to try and sound like he is a black person. i think everyone should just be yourself. it is not important and try to sound like someone else. do your own thing. and if competition is where it is at, quit crying and start buying. some of these guys on channel 6 may not like it, for whatever reason, but if your radio equipment is doing its thing , you will be heard and they will have to admit that. trying to sound 'black' , as it is stated, is, in my opinion unnecessary. i don't know why people do it, but whatever. channel 6 is open to whoever wants to key up and can do so in a effective manner, no matter what race you are from, so to speak. but bad grammer is bad grammer no matter who uses it, and it is indictative of a lack of proper schooling and upbringing,.....cd is out.....

1357. Re: 50 ohm's ?

Newsgroup: rec.radio.cb
Date: 2000-07-09 00:00:00 UTC
From: 'Doc <w5lz@oio.net>
Message-ID: <3968BB7B.145C7F22@oio.net>
Source record: 43237

Bill,
Look at the set-up. The dummy load and jumper between the dummy load and the amplifier, are both of the same impedance. Since the jumper is a very small percentage of a wave length, it will act the same as an electrical 1/2 wave, and the load impedance(dummy load) will be present at the input of the jumper, and therefore at the output of the amplifier. This means that the amplifier 'sees' only the dummy load. Or, another way of saying it is that there are only two impedances to be considered, the amplifier's output impedance, and the dummy load's input impedance. The short jumper is 'invisible' since any reactances present in the jumper is negligible. Any feed-line affects are removed from the system.
The relationship of voltages (forward/reflected) between source and load gives you VSWR. The relationship between impedances is the same as the relationship between forward and reflected voltages. While you can not obtain the actual impedance of the amplifier output (you'll get two values), you are only wanting to know if the output impedance of the amplifier is 50 ohms, or not. Using an SWR meter WILL tell answer that question.
'Doc

Are you sure that the antenna needs to be grounded? I put together a mobile antenna system for my truck, had the thing grounded well and had the exact same kind of SWR, no power radiated and very high SWR no matter what I did. The antenna turned out to be a no ground plane antenna although it was not stated in the documentation that came with the antenna. I removed the ground from the antenna and now get consistent 1.1 to 1.4 SWR readings from channel 1 to 40. May be worth a try.

Initial impedance is gotten through design and device specs. The problem is that most high power devices are not characterized and have no scattering parameters to work with... soooo... the the efficiency is a good gauge for how close you are to the real world from your calculations. No more... no less... just a useful tool.

Source record: 43302

>>>Sorry... I can't agree
Those transistors in the 2pill section are not rated for for that wattage input. They may take it for a while but that is certainly a recipe for destruction of the amp. You would be incredibly deep into what is known as the "compression" area of the transistors.<<<

my amp is exactally the same as a 1 driving 2 , but it has no driver . so how you say its cannot take watts i have no idea . the guy who built the damn amp said 60 watts swing was ok . i think i will believ him over you.

proffessor , put your $ where your mouth is . i wanna buy one of your one pills .
alls you have to do is meet wit #12 and i and if #12 says its good . i will buy one

1374. RF Interference: which radios suffer least?

Newsgroup: rec.radio.cb
Date: 2000-07-09 00:00:00 UTC
From: Breen <nospam_red3golf@erols.com>
Message-ID: <8kaijq$h7o$1@bob.news.rcn.net>
Source record: 43304

Hello,

I just installed a Cobra 75 WXST CB in my Jeep, it was the only one small enough for my needs, and now I find that there is terrible RF interference from what I believe to be the fuel pump. It is a high pitched "shrieking" sound that is constant regardless of engine speed, and causes the meter to go from 2-3 to about 6-7 when the engine is running. I have a Firestik II 5' antenna mounted on the left corner of the rear bumper (fairly close to the fuel pump), and the mount is fully grounded to the chassis. I know the interference is coming through the antenna and not the power wiring because it disappears when I disconnect the antenna. I'm not to the point yet where I want to drop the gas tank and install a filter to fix this problem, so finally my question is: are there any radio sets or antennas that are immune, or at least less susceptible, to this RF problem? Also, does anyone know if there is a DaimlerChrysler TSB about this problem for MY2000 Jeep Wranglers?

Thanks in advance,

Breen

Yep, get some quite strong incoming, some from up to 20 miles away at times!
(This suprises me, probably not you guys though). I get a perfect short on
the centre of the co-ax when using my digi meter.

Still no luck

Source record: 43312

Check in the ARRL handbooks, if you want solid state go for the newer handbooks... If your interested in tubes go for older ones... some other sources would be SAMS of some CBs which had seperate tx/rx , Demco, Buddy, Sampson, Browning, Etc....

Agreed... some antennas have coils that are a DC short. However... they are
not a short at RF frequencies.

Try a SSB radio. All the AM units I tried got a lot of noise. If you turn
the key on without starting, you will hear the fuel pump for a few seconds.
Then when you start the motor, you hear the injectors. My jeep would be
full scale when I first got it. Now, I'm wired to the battery, my bumper
is ground strapped to the frame, and my PC-122 only gets lots of noise in
park or neutral. I use a Firestik KW-7 and talk anywhere I want to. <:

1400. 257 Magnum Delta Force, This Is A Cool Little Radio

Newsgroup: rec.radio.cb
Date: 2000-07-09 00:00:00 UTC
From: Frizz <senorpurpl@hotmail.net>
Message-ID: <8kavs0$b1d$1@bob.news.rcn.net>
Source record: 43330

Just hooked mine up today, and fooled around with it but I had no time for contacts. After the few minutes that I worked with it, I decided that this is a nice little radio. It looks well built and has nice smooth controls. Audio test with another radio was great considering the stock mic. The channel mod was easy and the radio now functions as I want it. Anyone looking for a new one, get this radio! Its cool!

I think you would be much better off using vhf or uhf, rather
than 27 Mhz. Not only would you have better bandwidth capabilities,
but you wouldn't have the problem of 4 million idiots yelling
"Aauuudiooooo" into your modem.

I have noticed lately that Ebay has been canceliing auctions on 2510's, Lincolns, and even the regular Grants. The 2510 can be in the correct area, and the discription worded correctly and Ebay will still torpedo the auction. Whats up with this? But yet they leave other auctions alone that is obviously auctioning a wide-band radio in the CB area.

I know Ebay isn't for everyone, but this is(WAS) a way for people to have a chance to own some great radios like the 2510, lincoln and the awsome little Grant.

Hello David: Yes I've seen this, I e-mailed E-Bay on the a few times. They give a pre-arranged answer. I told them that some attorney could rip them a new a$$ hole over it.

The boys at E-Bay are through for the day if they break a nail! Follow the rules kiss everybody's ass, they tell each other how important they are, but their not complete in looking over the E-bay lists of auctions. I'd some of them boys looking in, from outside the fence.

Don't exactly know what a pyramid power supply is. But in general, if you want to parallel power supplies together, you should use a diode in series with the each output of the power supply to isolate each from the others. You will be looking for a diode that has the current capacity of 12A, with a low forward voltage drop to reduce any loss (like a Schottky diode). They should not be too hard to find, although I doubt Radio Shack would have it.

I thought it was clear but maybe not...
What I was saying was that most large power RF devices don't have scattering
parameters on the data sheets that come from the manufacturer.

i'm read on one of ebay auctions, i think i typed in "astron" with the search titles and description box checked and someone said that if you hooked two or three 12 amp or any kind of power supply that you would get double amps. All you got to do is run wire jumpers from the black side and wire from the red side and keep on repeating that pattern on all the power supplies. and another thing, you can buy pyramid 12 amps power supplies of ebay for like 35 - 40 bucks, you can get a new astron 35 for like 120 -130. you dont save much money buying three 12 amp power supplies, but your saving 85 bucks. so i would think buying three power supplies is cheaper.

hope i didnt damage any skulls!

At this stage there is no Australian CB news group (yet). There has been a bit of talk about getting one up and running but there hasn't been to much said on the subject for a month or so. Generally we end up using the ham or scanner news groups as well as hanging around on this one. A lot of shit is thrown around on this one but there is also a lot of good useful info to be found here - personally I really enjoyed the review done a month or two ago on the dish antenna. Oh and by the way no sign of the idiot here in Canberra, Australia - what are the twits normal operating hours and does he operate on other channels other than your call channel?

Cheers

Matt

Numerous states have laws under consideration that would ban the use
of mobile telephones while the vehicle is in motion, except for those
that are hands-free. The ARRL has been keeping close tabs on all of
these laws and publishing information in QST Magazine. So far, NONE
of the laws affect the use of two-way radios. Most, in fact, specify
that the use of two-way radios is NOT included in the law, ONLY the
use of telephones. Most also exempt law enforcement officials from
the phone law.

Don't get up in arms about them "having privileges" that we don't.
MANY law enforcement agencies are going to PCS phones because it's
impossible to de-scramble them. Too many criminals use scanners to
know where the police are and what they're doing, and it interferes
with law enforcement, especially drug busters and other covert ops.

For the time being, and likely the future, radio ops are safe from
these laws.

Personally, I whole-heartedly support making it illegal to use a
phone while driving. I've lost track of how many dozen times some
jackass on a telephone has nearly collided with me or someone else
on the Dallas highways and byways. And then there are those who
get into the left lane, get a phone call, and gradually slow down
as they drive, not realizing that they're clogging up traffic by
doing 10 to 20 MPH under the speed limit in the "hammer" lane.
DUH!

73,
Dean

If you guys want some real advice, here goes, as your radar detector starts going off, key up those big boxes of yours and start whistling. Chances are that the RF will interfere with the radar and the cop can't get an accurate speed. Of course if you've already been locked in, it's too late! :)

I owned one and the only reason I sold it was because I got my hands on an RCI-2950. Make sure you hook a power mike to it, get the clarifier mod and and do the very simple channel mod to expand the tx/rx and it's well worth it. I don't advise using it mobile unless you can find a good way to dampen the noise because they seem to be very subseptable to engine noise (Then again, most radios are..)

This brings up something that I found interesting...

I was looking through the manual for my work radio one day and right at the front of the book it says not to use the radio while driving.. duh, isn't that what it's for!? :)

As for cell phones, there should be more places out there enacting laws that prohibit people from using a cell phone while driving unless they are using a hands free device. That would actually be MORE safe than CB's or ham radio because you don't have to key a mike to talk every time!

Perhaps climate has someyhing to do with your luck, or mine, on crystals.... I have 8 different brownings, all of them have original crystals, none are so far off frequency that they could not be brought back on. I've also bought and sold at least 10 Brownings in the last few years, and had no problem, other than 3 dead crystals..... As for recieve the older ones are perfectly fine, even better than most compairable radio gear... You do need to make sure they are PROPERLY ALIGNED, if not they can be terrible.... My favorite recieve is the early ones with the Collins mechanical filter..... And opinions never need an apology!!

Cobra 148 ST has Night Watch green backlight faceplate, new in box complete. Removed from box only to have peak, tune, and super mod by very reputable cb shop in Ennis, Tx (Jims cb shop). Bought unit for father he was'nt interested, oh well.
Asking $150 + $25 (for tune up) unit is absolutely brand new and apperance is flawless.

With all the recent rumours of health problems caused by cellphones etc., has anybody heard anything similar regarding CBs (with or without linear amps) ? Should
mobile users be wearing a lead hat when I keying up in the car due to their close proximity to the antenna ? (Only kidding).

Richard.

I tend to agree with the cell phone ban while driving. In the 70s when cb was at a peak, I cannot recall any times being behind someone who's driving was affected while on a cb. With a cell phone, driver inattentiveness appears to be the norm. For some reason, when one takes a cell call while driving it appears that they must slow the vehicle to a ridiculous speed. Too many folks in the gene pool unable to walk and chew gum.

I would call that some real bogus advice if your radar detectors is going off it may be to late.And as close as you would need to be to trip the rfi circuit with big watts you would already have been "locked on " dont forget police use 50 watt radios as well so the rfi defeat is not that sensitive. , and if they are using instant on you have no shot in hell.

Don't kid yourself Richard you are a 100% right about that. Primarily the people that use amps in there mobiles. There is a very high Electro magnetic field around the car. This field is able to penetrate the car, especially glass. I have thought about this myself a friend of mine told me the best place to try to eliminate some of this is having the antenna on top of the car. I don't think there have been any documented cases of anyone getting the big C from a CB but that's what they were saying about Cellphones and high power towers. I have noticed a bad twitch in my left eye, hope that it's nothing.

P.S. I have also noticed my hair falling out too

>With all the recent rumours of health problems caused by cellphones etc.,
>has anybody heard anything similar regarding CBs (with or without linear
>amps) ?

The reason that cell phones could possibly pose a health hazzard is because of the frequency used - in the 900 mhz. The levels of power used by cell phones are so low they are not dangerous, but if you increased that, it could litterally start cooking you... as far as CB's go, the only hazzard you have is that with ANY radio setup, RF exposure. Increased power and the placement of your antenna will affect how hazzardous it is. The standard CB'er, even with a small amp, doesn't have much to worry about unless you keep your antenna inside of your car... :)

The output impedance of the amp will have no effect on the swr. SWR if a function of the match between the feedline and the antenna. Doc, you don't even know how much power it takes to 100% modulate an AM carrier, how could anyone take you seriously on this?

> If the input impedance is high will it make the swr high on the output?

Nope. I was wrong. I just did the
experiment you mentioned. Mistuning
the amp didn't change the SWR. It
doesn't make sense but it's true.
You'd figure a mismatch in either
direction would change the SWR but
it doesn't. It's another case of
SWR meters not being as useful as
they're cracked up to be.

> watts.
==========
what about them? You are saying you talk around the globe on am with 4
watts on the cb band ? Is that bragging or bullshitting?
I dont have to buy the box i can build it so i guess i am not a fool. Do it
barefoot? I guess your one of those guys who has never had there radio
tuned. You run it stock out of the box .. yeah ok .. I have a big big
antenna, 4 watts goes along way do you want to see the qsl cards? ...hmmm..
where did you state you don't run big watts and why would i really care.

>You brought up the power issue. The two issues are related, but
> nonetheless separate. But it is obviously clear you are of the mindset
> that bigger is better. I will not try to make you see otherwise.
==========
Yes you ask me how would i bust a pile up with my low level modulation,i
would kick it up a notch Sonny... btw.. My girlfriend also is under that
mindset.

> Heheh! Sorry, but my equipment is just fine.
==========
For you it may be fine you never mentioned what type of radio it is so how
can i comment on it...

> As you stated, low level modulation not made for the cb band on AM. My
> posts specifically alluded to the cb band. So you tell me, does it sound
> logical for you to purchase a super high $$ rig for cb when, self
> admittedly, it is not made for cb, and have to run an amp to keep up?

==========
The thread was regarding bleedover it happens in every radio service i mentioned a kenwood and you said " you heard they were garbage" when moded for cb. I say they are not, and know they are far superior radiowise on any band to any cb on the market why because i have one and own many cb's i can make that comparison can you ?. I did not say it was a cb or to use it on cb. it doesnt need an amp to keep up, how do you bust the pile up with those 4 big watts and your super audio that is not overmodulated.

> And then to turn around and say there is no comparison? Please! There
> are tons of radios that will stomp that TS and drag it up and down the
> band by it's hairlip at the same low wattage on the AM cb dial. If I
> have to explain this to you, it is YOU, sir, not I, that doesn't know
> his equipment.
==========
you have this stomping fetish ... you try to act like you are mr. clean and only run 4 watts am and 16 ssb and have this crystal clean audio. while i am telling you the reciever will hear things you have only dreamed were out there cant talk to what you cant hear first rule of radios. your right you are a little slow..

Some of the boxes come from the maker pumped (i.e. competition models). Now what I don't understand is why don't BB stay with one particular brand (although they are all DAVE based amps)??? Don't know BB personally but from what I hear from those that do, his antenna systems is really what puts him in front. 55's antennas obviously works. I hope he goes AC Sky here in the near future. Get him out of DC Classes (kidding).

I hope I didn't squash your noodle...

>
> bill , isn't there a way for him to hook those up and get the same load
> to each unit?

Yes. Put them in parallel (all three positives
together and all three negatives together), set
up a small load like one or two old car headlights,
and carefully adjust the voltage regulators on
each unit to achieve the desired voltage and
share the load equally. The voltage regulator
adjustments are critical if he expects maximum
current from the trio as a whole.

Balancing networks made up of diodes and
resistors can be used, but they lower the
efficiency (by consuming power and producing
heat) and they don't relieve you of the
job of balancing the load between the three
units.

Bill, I am glad you tested for yourself and saw the results. But don't bad dog the swr meter it is not supposed show you this. As i said try a bird meter as well " yes, i know doc he may have to calculate the swr from the forward/reflect readings.

Thats why it makes me laugh when people say ... ohhh those amps have high swr... how the f.. would they even know...

Message-ID: <6ita5.21330$L8.65935@east3.usenetserver.com>
Source record: 43473

No... it makes perfect sense. The SWR meter just checks the antenna against the transmission line... no more... no less. That's why even though your match shown on the SWR meter can be peachy... the amp can get hotter than hell and have a terrible match to the feedline/antenna. This results in a very poor power transfer out to the antenna...
In this instance... most of the power from the amp is being reflected back into the amp and is lost heating the sink.

BB is not married to any amp maker... He can basically run them all and win with his antenna setup.. i also beleive BB sets up his own antennas ... With the help of 55 on occasion...

Source record: 43476

But be careful... the SWR meter will give very accurate readings when put between the set and the amp. It will then be reading the transmission line vs. the amp input impedance. This is a useful reading when evaluating the input impedance of the amp and how well it's matched to get the power into it !

Hello Train: Yeah I can believe that. What reason would some goof at E-bay care about what category you would use. To justify his/her job, or are they just that unbusiness minded? Being a tight ass may work in some hierarchy, but not in a public auction forum, where the publis is paying the bills. They will find out, if the management is keeping their ear to the ground, and profits vs goof balls.

It appears that E-Bay has gotten to large, now having meetings, bean counters, needle dicks, rule reciting goofs, and traffic cops. Pity that a large money making company can't be managed by a street smart manger.

My services are available. I am terribly expensive, would need a cut of the improved profits, over a certain period of time. I would start with having a few of the Bozo's taken out during peak working hours in hand cuffs, the word will get around, GO TO WORK, use your head.

There I feel much better.

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

What happens when there is no transmission line?
In other words, the SWR meter is connected directly
to the output of the amp, and the feedline and
antenna constitute the load. Using your analogy
the amp is the feedline and the coax and antenna
is the antenna. You'd figure one is being checked
against the other but it's not. For example, a
25 ohm source feeding a 50 ohm load shows up as a
1:1 SWR when it should show up a 2:1 SWR.

> That's why even though your
> match shown on the SWR meter can be peachy... the amp can get hotter than

> In this instance... most of the power from the amp is being reflected back
> into the amp and is lost heating the sink.

What you've listed here are consequences, but
your explanation still doesn't explain why an
SWR meter can't detect an impedance mismatch
when it's the source that doesn't match the
load.

You are paying attention, just not enough! As for what I look like, you ought to be glad you don't know! If you knew, your ol' lady would know and then you'd lose her too! Read the entire post...I said "heard", and if you could get your pink panties out of a wad for a moment and read some more, I also stated that I heard the opposite as well. You jumped on a portion of my post that evidently struck a nerve and it is probably due to the fact that your Kenwood is not living up to your expectations and you felt the need to defend it. If it were not true, you would have thrown what I said out the window because you already know the truth and why should anything I say ruffle your feathers? Think you are the only Kenwood owner on the group? You would be surprised. But you are the only one who took issue with it.
Reread my posts. CAREFULLY. You will see where I stated I do not run mega power. Yes, I talk around the globe barefoot(4 AM, 12 ssb) Don't have to brag, don't have to bullshit. Went this way last year with some other operator who said it couldn't be done. Many proved him wrong. How do I bust the pile-ups? Simple. Location, location, and more location coupled with great antennas. You are not the only one who gets off on big antennas. If you have a great radio antenna, yes, you can hear thngs you wouldn't believe. I don't need an HF rig for that.
I didn't mention what radio I run because I could care less your opinion on it. I did not solicit your view.
Yes, the thread was regarding bleedover, however my post was not related to bleed. It was stating something I was told on several occasions. I guess you can't distinguish between hearing and believing. Just 'cause someone says something does not make it true.(twice now) If you try real hard, you may come to grasp this concept, although I doubt it since you are so far gone as to say that TS is a hotshot radio on the AM CB dial, which every one of my posts have stated. You are back pedalling something fierce as you keep reaching to say "other bands". Again, reread my post there, junior. I stated on the CB band and I hold to it. Get that overpriced, high-end CB at 4 watts, hell, make it 8 watts, on the CB AM dial and I'll throw a damn barefoot Tram MOBILE on there that will slap you silly! You have a great deal to learn. You may have some theory, but you lack comon sense!

I have (2) Uniden HR-2510's for sale. Both have been peaked and clipped.
Both produce about 40 to 45 watts each. One comes with a Sadelta ME-3.
Both are fully functional. Best offer over $200 for the one with the mic.
Best offer over $175 without.

As long as the Tubes are strong (output would indicate they are) and its pretty decent cosmetically.... However I think $500.00 is stretching it.....
But then again I'm thinking comparison to about same output amps running 500z's at around same $$$ You would need the right guy to approach $500... Ebay is about $300 give or take $100, depending on condition and if Nice photos are up... And typically I consider Gouge Bay pretty much top buck on that type of piece....

Hello Guys,
I have a question for you, I am having a noise problem on SSB now. I am pretty sure that it is engine noise , as it isn't there when my pickup is off. This just started a week or so ago, on a.m. it is still there but is worse on SSB. On my 2950 it is showing up to 3 flashing 4 bars of noise. I have noticed also that my battery has formed a little corrosion on the terminals would this cause this ? I have the radio ran directly to the battery.

Any ideas ?
Tinker

Ben is right..... Ebay won't pull an item unless some self appointed Gestapo type person bitches.... I personally recieved an email from a fellow ham..... ARGH..... Who cannot mind his own business and has NO LIFE other than sitting on the auctions and picking what he sees as illegal items and emailing complaints, I first found out about this lifeless idiot by a post on I believe it was Shadows WWW (or something like that) Keydown page, she has a link off bigradios, she posted the email that this MORON had sent her email, threatening to give her GUFF for endorsing illegal activities (breaks/keydown) dates location, I believe he threatened to narc to her ISP or some other impotent threat..... well anyhooo... I emailed this lifeless scum, bringing up some rather good points as to why he should get a life... Well seems this Skitzo prick has a VENDETTA for 11 meter radio operators, and is making it his life purpose to one handedly stop illegal sales of questionable 10/11 meter equipment..... DSS Hcards or Amplifiers, it matters NOT, to good old dipshits of Ebay, If the Add is properly worded and typically DOES NOT mention CB, and is in the proper category the auction WILL go on..... If not a LIFELESS HAM will have it killed..... I guess they Knuckle under so easily because there IS potential for a loss on there part... FCC COULD do the Notice Of Apparent Liability thing or whatever the hell it is... And Ebay could suffer a substantial loss.... Don't everyone get all TEARY EYED at that thought! (SARCASM).....

With that consistent of wins i seriously doubt it is the amps doing it....yeah sure they might be tweaked to deliver a bit more, but I'm sure others are doing the same..... gotta be the antenna setup..... Guess thats what happens when everything works together....

I came upon a this piece of information.....
If you keep the original proportion of an object, and DOUBLE the
height, the weight will go up by a factor of eight.

The above statement conflicts with this.....
In order to DOUBLE the distance in free space, the RF power
will have to quadruple.

Question: Both the object and the radiated RF field are three
dimensional. Why is the math different between them?

Hey, I never thought of that! I remember that from physics now! maybe that has something to do with it? Would it make much difference though, if the outer just wasn't connected?

>I have a President Washington older version based

>So these radios are classic keepers for collectors and users alike

I agree, they are good keepers. One thing I use to do when ever some one would complain about bleed over of over modulation. I would go out side to my mobile in my drive way, and have my wife talk on my base. If my base sounded ok on my mobile, and didn't bleed, I assumed my base was ok.Very seldom did my radios receive undo bleed over or were over driven by some one else. I still maintain that it is the quality of the radio that determanes bleed over for the most part.

Yaa Yaa as the story goes. Sounds like the next best thing you can do, is talk
on the same channel you receive the bleed over from. Who ever is doing it to
you will ether befreind you, or get sick of you, and turn his radio off.

dont think thatll work...Sounds good in theory, but i dont think the power supplies are gonna like being hooked up like that..Astron makes a "bridgeable" 50amp supply that can be hooked up to another, totaling 100amps DC. Once ya have that, ya kinda forget everything else.....Anyone know of a smaller amp bridgeable power supply ????

1534. URGENT - You can't talk while you drive in Marlboro, NJ

Newsgroup: rec.radio.cb
Date: 2000-07-10 00:00:00 UTC
From: Stan Olochwoszcz <phantom.hawk@worldnet.att.net>
Message-ID: <B58EB304.5AB7%phantom.hawk@worldnet.att.net>
Source record: 43514
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.cb

The Marlboro Township, NJ council has introduced an "emergency" ordinance to prohibit the use of cell phones while driving.

This ordinance is a knee-jerk reaction to a CNN story about an individual killed by a driver "distracted" while on a cell phone. The ordinance sets a dangerous precedent and is unnecesary. We already have a careless driving statue in New Jersey which can be used to prosecute such cases. The ordinance may violate the 14th amendment to the Constitution by creating a class of drivers who would de facto be profiled and lose their right to equal protection under the law. And it singles out only one of the many possible distractions which can cause such inattentive driving.

Councilman Barry Denkensohn, in an interview on "Spectrum" (Saturday WWCR 5070 kHz 11 PM ET), indicated that this ban WOULD LIKELY APPLY TO HAM RADIO AND CB as well since one would not have two hands on the wheel while talking!

This ordinance must be stopped! There is a hearing on the ordinance Thursday, 13 July, at 8 PM EDT. Show up if you can, but at least contact the Marlboro Township council and voice your opposition. The names and addresses you need are available at http://www.marlboro-twp.com under Organizations>Township Council

FIGHT THE PHONE BAN!

You know it is funny you said that because I have always thought that certain white guys (mainly from the south and midwest) seem to have that so-called southern drawl that also a good many black guys have as well. Especially if the have the so-called southern accent. Although I am from the north I went to college in the south and this is where I learned this. Most of the guys in my neck of the woods DO NOT have this southern accent mainly found on the superbowl. However the majority did try to emulate it, because it seemed the norm. When I went to college in the south I was quite surprised to meet several good ole boys on the cb. We talked for more than a month and guess what??? Because of the way that they talked I presumed they were black fellas. THEY WERE ALL WHITE!!! After that my northern friends and I deduced that white fellas from the south and black fellas from the south sound exactly alike!!! I found out that this does not just apply to cb either. My white friends from the north sound completely different from my white friends in the south. Matter of fact my northern white friends probably couldn't understand some of the southern dialect at all! I would deduce from this that there are many southerners and mid-westerners on the cb and talking skip in general. These are my experiences. I think that when these guys hear white guys on the superbowl and presume that they are black, they are making a big mistake. Could just be some southerners with that southern drawl (black or white).
Later,

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

If it were a better power supply than the pyramids you could probably do it. I know the one I have drifts bad enough that I would not use it like this. I had some 20 amp switching power supplies that you could strap together. They were made so you could series or paralell connect them.

Heck, I would just get out an antenna book and build a 2 element quad. Its easy enough and quads are very forgiving if you don't do every thing just right.

Don't thank me, I was not agreeing that it was a good idea. If you are using this as a base antenna the cap is very short lived. All it takes is a near by lightning strike to blow it.

I know it does not effect the actual SWR, but I am not so sure that output impedance of the amp will not effect the reading.If the carpenters and painters get through tommorow I may try a little experiment to verify this .

Just about every Eagle I have seen in the last 5 years needed new crystals for the TX. The idea of replacing all those crystals never turned me on but I do like like the way one sounds. For this the TX was hard to beat. Never cared that much for the receivers. The only ones I have tried are the III and earlier so if the IV was much of an improvement I apologise.

Along with the diode he needs a little resistance too to balance out the
current load. Maybe a .1 ohm at 10 or 20 watts. watts.

: the centre of the co-ax when using my digi meter.

Not surprising. Many antennas will show a DC short. That is not the same as
an RF short.

'Doc <w5lz@oio.net> wrote:

: Bill,
: Look at the set-up. The dummy load and jumper between the
: dummy load and the amplifier, are both of the same impedance.

We would hope so, but such a match is not necessary for the
meter to provide correct readings.

: Since the jumper is a very small percentage of a wave length,
: it will act the same as an electrical 1/2 wave, and the load
: impedance(dummy load) will be present at the input of the
: jumper, and therefore at the output of the amplifier. This
: means that the amplifier 'sees' only the dummy load. Or,

Wrong. A fractional wavelength is not the same as 1/2 wavelength.

The amplifier sees an "input impedance", which may or may not be
the same as the characteristic impedance of the coax. But that
is immaterial, since all that affects is how efficiently the
amplifier couples power into the coax.

: another way of saying it is that there are only two impedances
: to be considered, the amplifier's output impedance, and the
: dummy load's input impedance. The short jumper is 'invisible'
: since any reactances present in the jumper is negligible. Any
: feed-line affects are removed from the system.

Wrong again. If the characteristic impedance of the coax is not
the same as the impedance of the load, then there will be a SWR
indication that is not 1:1.

: The relationship of voltages (forward/reflected) between
: source and load gives you VSWR. The relationship between

Again wrong. The relationship of the power that reaches the coax/load
junction compared to the power that is reflected back towards the source
at the coax/load junction (due to any impedance mismatch) is what causes
the SWR.

: impedances is the same as the relationship between forward and
: reflected voltages. While you can not obtain the actual
: impedance of the amplifier output (you'll get two values), you
: are only wanting to know if the output impedance of the amplifier
: is 50 ohms, or not. Using an SWR meter WILL tell answer that
: question.

Show me the math.

In the 30 odd years I have worked with transmission lines and antennas,
I have never seen the phenomenon you claim will occur.

: transmit and set the clibration knob so that the needle reads SET. I then
: flick to REF and read off, is this right? It's what a book I borrowed said.

: Anyone clue me up on this?

If you are getting the effect you described with your first posting, then
either the meter is defective - or the labels for the XMTR and ANT are
backwards.

It is impossible, with a properly functional meter that is hooked up
correctly, to have a reverse power reading that is higher than the
forward power reading. That would mean that the antenna was creating
power and feeding it back down the coax towards the transmitter.

Try changing the ANT and TX connections - then following the SWR testing
instructions.

>and if they are using instant on you have no shot in hell.

Not really. The radio in my vehicle affects my radar unit. Whenever I key the mike, the radar displays "RFI", indicating interference... I've affected my radar also with the use of a handheld radio and my cellphone - they call cause RFI to interfere with the use of the radar. It is logical to assume that a CB (especially high power) will affect the radar unit in a similar manner. Therefore, if I am clocking someone, I can't talk on the radio or I lose the signal... As far as "instant on" radar, that's a crock. In order for an "instant on" radar to work, it would have to know when to turn on and to do that, it would have to receive a signal that a car is coming (by bouncing a radar signal off of the car...). So as you can see, "instant on" radar can't exist. You can keep the radar on "Hold" so no signal is going out and when you are in range of a target, just hit the hold button again and get the speed.

I hope that answers your questions about radar.

ASSumptions, ASSumptions, ASSumptions! See previous post. I call 'em as I hear 'em! Odd thing is...when most of us hear that ultra-fine sounding radio, we usually ask what the guy is running and it tends to stick in the mind. Lets see, Cobra, Tram, Dak, and Galaxy come to mind immediately on the cb band. Take 10 cobras at random and 10 kenwoods at random and see which brand sounds best on the AM cb band. By at random, I mean not radios that have had their innards douched. I addressed this once before about affordability. My personal position is why spend that kind of money when one can achieve the same results at a fraction of the cost? The alfa tangos require 100 confirmed countries before membership. I do not have an HF rig, but I must be doing something right, and I don't use mega power. Nothing against Kenwood, but that don't make you elite just 'cause (in your words) you can "afford" it. Some may even feel it makes you stupid, especially if you ain't a hammie!

At what point are they garbage? they use low level modulation, now most cb folks like to hear that loud over modulated audio and If you try to run a kenwood like a normal cb well it just wont have that " loud over -modulated cb radio sound" , If you are looking for good clean clear audio then perhaps you would want to use this type radio. As far as the reciever there is no cb radio on the market that will compare to a kenwood ts 850's triple conversion super hetrodyne reciever.

Sigh. What happened to personal responsibility? Dateline recently
broadcast a road test which clearly demonstrated that driving while
tired is just as bad as driving while drunk.

If you are in a collision (I have an intense disliking to the word
"accident") and it was your fault, you should pay. The issue of
whether you were drunk, tired, applying makeup, shaving, talking on
the phone, drinking coffee, or reading a map is irrelevant.

Those who screw up should make things right. If they have subsequent
offenses the license should be placed on probation. If there are many
other violations, then the license should be pulled. We shouldn't
have people driving while stupid. It's that simple.

We should make a law against such laws :-)

I have one of these amps and mine does about 900 watts on AM. Say what you will about the look of the unit or its age but it still talks as well as the day it was made.

But the lockup time on even old guns, like the Kustom Signals KR-11 is less than a second. No one is going to beat that indication. Even the older crappy Electromatics would lock in just over a second on a good reflected signal. And the newer units with DSP? They should lock 'almost' instantly. In fact, I've heard that the delay in the lock is due to their error checking, comparing multiple readings to check for deviation. It's what's REPORTED that 'appears' to be a delay.

And it's not going to be at any range even thousands of watts would possibly affect. About the only time a ton of power on ANY band other than real close to the radar band would have any 'REASONABLE' possibility of affecting the unit would be if you set up in a 'protected corner' and were instant nailing people as the curved around into you right as they passed.

At what point did I call a Kenwood garbage? I didn't. As far as receive, I never have a problem. People I hear can hear me. That is good enough. As far as crystal clear audo, I have that as well. I prefer DX, where lots (read: not overmodulated) of audio will get over FM broadcast like-sound every time. What good is crystal clean audio if you can't get through the pile-up? I don't ever remember thinking, "you know, that guy's audio is so clean, he must be running a Kenwood TS 850, and , gee, he can hear me so well, he must have the triple conversion super heterodyne feature." Doesn't apply!

1589. HELP - Thru-Glass CB Antennas

Newsgroup: rec.radio.cb
Date: 2000-07-10 00:00:00 UTC
From: Chip <chiph@NOSPAMmultitech.com>
Message-ID: <lxpa5.1785$yd.132687@news.uswest.net>
Source record: 43569

Have a Thru-Glass antenna, I believe Midland, mounted on a window high on my motorhome attached to a Cobra "all-in-the-microphone" CB transceiver. The wip is coil loaded but looks to be a 18 inches tall.

To say the least, I can hear some truckers talking when they are within eyesight, but, no one will seem to respond to my request for a radio check.

Is my antenna bad, or the Cobra a piece of junk, or both? Are these antennas inferior for CB transmissions, but OK on receive?

>
> Negated by the level adjustment in the SWR meter.

Nope. You'll notice many of the better SWR
instruments have more than one scale and
instructions that describe how to use the
different scales based on level of transmitter
output power. The trend is that the needle
deflection in the reverse (aka reflected or
SWR) position will increase with increased
TX power. The higher power scales compensate
for that.

> : instability in the amp; antenna breakdown; and, an impedance

> Amp instability could change the harmonic content - so the indicated
> SWR could change. You are also correct about an antenna breakdown.
>
> However, a change in the impedance of the output of the amplifier (what
> this whole discussion is about) will NOT affect the SWR reading.

I don't know what you base that statement on,
but it's not true. The degree of impedance
mismatch is directly related to the amount
of reflected power regardless of whether it's
a load that doesn't match the source, or a
source that doesn't match the load.

Andy there is a thing called instant on it is when the operator sees a target vehichle they hit the stand-by switch now it is instanly on.. In other words it is not in transmit mode, until the radar operator tells it to. Not very hard that is what it is called in my state...
I also agree a cell phone or your handheld placed very close to the counting unit will blank the unit causing the rfi lite to come on ... But driving down the road the radar will pick up your vehichle much further away than your cb with an amp will ever be able to " blank" the unit.. There are many radar that are having there rfi circuit disabled with the on-board cameras, computers and 2-way radios setting it of on a regular basis.
In rhode island the Stalker -ATR ka- band handheld is big with your state police the range on the ka band is sick(great). the company i work for is a warranty/service center for Every major radar ManufacturerKustom Signals, Mph, Stalker, Decatur . You guys break them i fix them... Better yet if you have any of the "new" speed sign trailers in your are drive by one and key up see for yourself how far away you have to be to blank the unit...

Buckaroo wrote:
>
> If I bought three pyramid 12 amp power supplies and i hooked them all togther,
> would they give me 12+12+12=36 amps,

Yes, as long as each one will really do 12
amps. Pyramid supplies are usually over-rated
when it comes to current.

> could i do it and still have 13.8 volts?

Again, as long as the each unit will supply
12 amps at 13.8 volts, *and*, you match the
voltages so that they share the load equally,
it will work. Matching the voltages is the
tricky part. If the voltages are not equal,
there will be units that are working harder
than others.

> you could SAVE ALOT of money that way.

I guess you found a deal on 12 amp Pyramid
supplies--right? In my opinion, one 35 amp
Astron supply will probably outperform three
12 amp Pyramid supplies, cost less, take up
less space, and not require touchy load bal-
ancing adjustments.

All you need to do here is post price and availability on the big
horizontal output tubes (like you did with the M2057s) and any
real transmitting tubes you might have. You'll get alot more
business that way than you will asking people to send you a list.

==========
perhaps that is good enough for you , But it is not for those who like to
talk to make a contact with those who are on the fringe of being able to or
not, being able to push a button or turn a knob to "filter" out the
bleedover, rfi,emi, static, well you get the idea.

>As far as crystal clear audo, I have that as well. I prefer DX,
> where lots (read: not overmodulated) of audio will get over FM broadcast
> like-sound every time.

What is lots of audio if it is not " over- modulated" What is 100%
modulation? If you are talking AM dx and trying to get over people I guess
you also never heard a Kenwood driving say a 4 pill amp or 8 pill amp, they
have 2- 2879s as the final. so try to get over that, on SSB the Kenwood will
run circles around any of your cb radios I am sorry thats just how it is. It
is only low level modulation on AM . the kenwood is not made nor is it
legal for use on cb nor am i advocating its use on Cb. thats why i have
about 10 cobra 25/29's

>What good is crystal clean audio if you can't get
> through the pile-up? I don't ever remember thinking, "you know, that
> guy's audio is so clean, he must be running a Kenwood TS 850, and , gee,
> he can hear me so well, he must have the triple conversion super
> heterodyne feature." Doesn't apply!
==========
What good is crystal clean audio? Ever heard crystal clean audio with some
watts behind it? Nah I guess you havent... I wouldnt expect you to say you
have since it is obvious you don't know what is actually good equipment or
not.
>

Yea, those were the good 'ole days. I remember when all the news stations in the south had accents when delivering the news. Actually, I do not remember where I read it, but recall that the folks in Ohio actually spoke the closest to what we pass off as proper English, with the least accent. Of course this is getting rarer and rarer. Look how far we have taken the English language. None of us actually speak true English anymore, but rather American slang bastardized version of English in many different forms. Is this country great or what?

I would say you have a below average radio attached to a well below average
antenna. Not being able to get a "radio check." Isn't a good way of
judging your radio's performance. My father has the same radio but hooked
up to a Larson mag mount and I can hear him well from 2 miles on my mobile
and 5 miles away on my base. The Larson Antenna makes up for the radio
slightly.

Just 'cause you say it don't make it true, or were you absent that day in kindergarden? You even reposted my post and still can't read it properly. Read it again, s-l-o-w-l-y this time, enunciating each syllable properly and you may catch it. If you can't, what you retort is irrelevant.
What ABOUT the watts a kenwood is pushing? Any fool can by a box and splatter the globe and talk wherever they want. That does not impress me. Do it barefoot (4 Am , 12 SSb) around the globe with confirmations and consistency and then you have some bragging rights. I mentioned the audio, not the watts. As a matter of fact, I stated I don't run big watts. You brought up the power issue. The two issues are related, but nonetheless separate. But it is obviously clear you are of the mindset that bigger is better. I will not try to make you see otherwise.
Heheh! Sorry, but my equipment is just fine.
As you stated, low level modulation not made for the cb band on AM. My posts specifically alluded to the cb band. So you tell me, does it sound logical for you to purchase a super high $$ rig for cb when, self admittedly, it is not made for cb, and have to run an amp to keep up? And then to turn around and say there is no comparison? Please! There are tons of radios that will stomp that TS and drag it up and down the band by it's hairlip at the same low wattage on the AM cb dial. If I have to explain this to you, it is YOU, sir, not I, that doesn't know his equipment.

You don't have to dial a number on a little peace of shit phone to
talk to a passenger. You don't even have to look at them.
You know as well as I do that when you talk on the phone you tend to
let your eyes roam around.

It's not a "needed LAW!" It's an unnecessary and unenforceable law. In addition to everything else their jobs entail, we're now going to ask police officers to check people and make sure they're not using a damn phone while in their cars?

You CANNOT legislate common sense. Attempts to do so merely make a mockery out of our system of laws.

Yes they were made in NC. One of the best modulating amps ever made. I had a real strong one in the mid eighties, and it was brutal in skipworld. Later I got a mobile super eight, and it worked well with a 102" whip. Not uncommon to get calls in the mobile from Canada, Mexico, Gold coast...while riding around in NC....
12DQ6B TUBES were cheap and still are for now.

.....

They're made (were made) out of NC weren't they? I remember a lot of people having them when I lived in Raleigh. They were damned loud too.

Check out the information on the ARRL or FCC web sites regarding the
regulations for RF exposure. If running high power in or near the 10 meter
amateur band there is a risk. If you are running a legal 5 watts there
should be no risk. Another reason to stay legal.

You are actually doing far without skip. SSB will get you a little further
but you aren't using SSB if you are on A.M. How do you do on SSB. I have
really found out if you don't have around 350-500 W you aren't going to
notice a big difference anyway. By the way, I sure anm hoping that you don't
think that if you have 200W that you will get out 40 more times better than
the stock 5 W because it doesn't happen.

Problem is Ebay acts much like the FCC. Some one complains, they react. They don't go looking for it. Some one emails," Hey!! he's selling a cd with illegal mods", they pull it and send a form lettter. Don't beleave me? Pick out a seller, email a complant to ebay about a hacked satellite dish card and see what happens.

I tried the test this afternoon using a Bird 43. I match my rdio into a 100 ohm load then put on a 18 ft cable terminated with 50 ohms. SWR was 1:1. Then set up the radio to match 25 ohms and repeated. There did seem to be an ever so slight increase in the SWR reading. If the effect is there at all it is not much. Perhaps other SWR meters are effected more. Would be interesing to find out. I have a couple of other meters of the cheap variety. They did not seem to be working very well(they have been on the shelf for 6 years) so I could not test them. If anyone else would like to try this I made up the 25 ohm load with 2 50 ohm dummies and a T connector and the 100 ohm load out of a couple of 2 watt resistors in paralell.

I'd agree if there was any evidence to back it up. However, the results of several studies show only a statistical correlation NOT a causal relationship between cell phone use and crashes. In fact, the number of crashes versus cell phones in use can actually be shown to have DECLINED. The general conclusion of almost all the studies is that the data are inadequate and inconclusive.

I wondered this too. Maybe the passenger can see that when you have difficult driving situations and shuts up, or he can warn you of a problem you may miss.

I noticed that I "space out" from my surroundings when talking on the phone at home or work. I don't have a cell phone myself.

I have a Uniden Washington CB with a Galaxy 200 Amp and a R/S 99 antenna that is 17 1/2 tall. I have it mounted on the highest point of my house which puts the top of the antenna appx 35-40 feet above the ground. I get good reception from all over the country when skip is right. The problem is that I only get out at most 50-60 miles on AM. I get fair reception on LSB. I thought with SSB I would be able to talk further than this. That is the main reason I purchased the Washington. I am open for any suggestions.. The Amp does not seem to help that much.

HELP!! I am frustrated..

The SWR meter must be built for a particular characteristic
impedance. It samples both voltage and current to perform a
directional reading. In order for the reverse voltage and out
of phase reverse current to cancel out of the forward reading,
the meter expects a fixed relationship between the voltage and
current -- the characteristic impedance.

Thus, an SWR meter measures the "SWR" for one particular characteristic
impedance even if no transmission line is employed. It measures the
"SWR" against a predetermined impedance; not the transmission line
impedance or transmitter output impedance.

I was willing to admit that it has nothing to do with the SWR, I was not so sure about the reading. It seemed logical to me that a device that was intended to be used in a 50 ohm environment may give an inaccurate reading if removed from this environment. Did a test today that seems to indicate it does not effect the reading either. At least not using a Bird 43.

I think y'all should just ignore him. He's definitely and obviously a disturbed man.
Why give him all the attention that he obviously wants? His preachings are negative
biased and paranoid to say the least. Who knows what his true motives are and who
the heck cares? He is obviously full of hate and that is worse than the fear he is preaching.
It is not the way to save all of us from any future catastrophe. All of mankind is still
"way primitive" as far as I am concerned. We (meaning all of mankind) think we are
so advanced technologically and mentally yet if an a supreme being from outer space
(or inner space?) were observing us and our behaviour towards things and amongst
ourselves, they'd probably conclude that we are a primitive life form with animalistic
instincts, analogous to how we (meaning mankind) view the animals in the jungles
of our earth.

Dang. We'll maybe a few of us human beings are advanced enough to see this. The rest of mankind
is just the "average Joe" driven mainly by primitive animal instincts.

Just ignore Dave and Debbie posts and buy and sell what you want and whatever is
best for you. Afterall that is part of what America is all about isn't it? I think Cobra's are
still an alright radio today and if you want to buy one or sell them, fine. Don't worry about
redneck Dave and Debbie posts scaring you into thinking that you are anti-American! You
are more American if you sell them because you then stand more for what America truly
represents. You are not a commie for selling or buying what you want to. Where did
all this paranoid shit start?!@$@!~!

Dang!

I have spoketh and will not speak again on this.

This is exactly one of the conclusions reached by the National Highway Traffic Safety Administration. One of the things that does affect inattentiveness either on the phone or "in person" was the emotional content of the conversation - according to the best (inconclusive) data, emotional state might be the bigger factor. The problem is that even the best epidemiological study can't separate the factors sufficiently to conclusive say using a "wireless device" is the cause.

BTW: The reason I became curious about source impedance affecting the readings is that a few of years ago I worked with some RADAR enginneers from Westinghouse. They would always put a 10db pad on the output of ther signal generator to make sure the output impedance of the generator was really 50 ohms.

This has pretty much been my understanding too. However you can't help but wonder whether or not placing the meter in an environment which it was not designed(source impedance of other than 50 ohms) would effect the reading. I worked with some Westinghouse engineers a while back that insisted on placing a 10 db pad on the output of a signal generator to insure the output impedance was 50 ohms. They checked an alignment I had previously done without the pad. They found no error though. They attributed this to the fact the the generator was a good match to but but stated that it may not have been and I should use the pad just in case. (sounds like a KOTEX commercial).

Bill Eitner <kd6tas@freewwweb.com> wrote:
:>
:> No... it makes perfect sense. The SWR meter just checks the antenna against
:> the transmission line... no more... no less.

: What happens when there is no transmission line?
: In other words, the SWR meter is connected directly
: to the output of the amp, and the feedline and
: antenna constitute the load. Using your analogy
: the amp is the feedline and the coax and antenna
: is the antenna. You'd figure one is being checked
: against the other but it's not. For example, a
: 25 ohm source feeding a 50 ohm load shows up as a
: 1:1 SWR when it should show up a 2:1 SWR.

Keep in mind that the SWR is the ratio between the power fed to the
antenna and the power reflected by the antenna (instead of being absorbed
by the antenna).

It does not matter if there is a feedline present or not. You can connect
the SWR meter directly to the transmitter and antenna. The SWR meter has
a short length of transmission line in it. The meter looks at the junction
at the antenna side for the voltage/current measurements. So the short
length of transmission line in the meter is sufficient to "isolate" the
transmitter.

If you could figure out a way to measure the RF currents without inserting
a meter between the transmitter and antenna, then you would not have a
transmission line to cause any mismatch. The mismatch would be between
the transmitter output and the antenna. THEN, mistuning the output would
affect the SWR.

'Doc <w5lz@oio.net> wrote:

: Bill,
: There's nothing like being obtuse, is there. Do the math
: your self. (Hint: impedance follows voltage) All I can say

So what? There is a difference between source impedance and
load impedance.

The source impedance (and the coax input impedance that the source
sees) determines how efficiently power is coupled into the coax. It
does not affect how much power is reflected by the mismatch at the
antenna coax.

If it did, then you could have a perfectly matched transmitter, coax
and antenna - which would obviously show an SWR of 1:1. By your theory,
if the transmitter was mistuned - the SWR would change. Try it, you
will find that this does not happen.

As I have suggested to others - do some reading on basic transmission
line theory. It is not hard to understand.

Hey all-
Have a TRC457 that operates fine in every way EXCEPT it won't transmit, SSB or AM. This radio's been kept very clean, in fact hasn't had any mods done to it at all.
But it doesn't do ANYTHING as far as TX goes, not the slightest bump on either meter.
Anyone know what the finals are in this radio? The numbers on the transistors are not helping me much.
C1306, C1307, and both have '1K75C' underneath.
Unless I'm really off the mark and these aren't the finals, in which case SOMEBODY help this idiot please!
Thanks-
Linus

1659. Cobra 19 Ultra II vs 19 DX 2

Source record: 43639

Greetings. I am considering the purchase of either a Cobra 19 DX2 or a Cobra 19 Ultra II. According to Cobra's web site, the DX2 is a compact, "full power" model, while the 19 Ultra II is a compact, precision tuning model.

For a beginner like myself who wants to be able to monitor radio traffic and use it for emergencies or when wheeling with friends, what would the practical difference between these two models be?

Please don't send any anti-Cobra hate messages. I am an American and proud of it. I also have the right to spend my money as I please.

Thank you in advance.

Scott

2SC1306 is the Driver, 2SC1307 is the Final, They are currently
out of production, I believe subs are available, however I've yet to find
subs that would do the power that the 1306/7 would do..... If you cannot
find them anywhere drop me a line i can probably help you out.......

Andy in RI <riradiobuff@aol.comspamsux> wrote:

: Not really. The radio in my vehicle affects my radar unit. Whenever I key the
: mike, the radar displays "RFI", indicating interference... I've affected my
: radar also with the use of a handheld radio and my cellphone - they call cause
: RFI to interfere with the use of the radar. It is logical to assume that a CB
: (especially high power) will affect the radar unit in a similar manner.

It sounds like something is wrong with your radar unit. Those I have seen
were very good at blocking out-of-band signals.

: Therefore, if I am clocking someone, I can't talk on the radio or I lose the
: signal... As far as "instant on" radar, that's a crock. In order for an
: "instant on" radar to work, it would have to know when to turn on and to do
: that, it would have to receive a signal that a car is coming (by bouncing a
: radar signal off of the car...). So as you can see, "instant on" radar can't
: exist. You can keep the radar on "Hold" so no signal is going out and when you
: are in range of a target, just hit the hold button again and get the speed.

And why isn't that "instant on"? The carrier comes on instantly when you
hit the hold button. If your unit is modern, it produces a speed within
a fraction of a second.

kal4cu,
Sounds like your doing about average. On a level 'playing fiels' SSB usually will extend your 'talk' range, but not a whole lot.
If you increase power to increase your 'talk' range, you will find that doubling the output power barely makes a change that you can hear. Doubling your output power is 1/2 an "S" unit. A full "S" unit is a 6db increase in signal. To get one "S" unit more on the meter, you would have to run four times as much power. After a point, increasing power is a waste of time and money.

Chip,
As most of these answers will say, you've got two strikes against you to start with. The first on is the 18" antenna, it will never work as well as longer ones do. The second strike is the 'thru-glass' mount. They just are not even close to being efficient at CB frequencies. Your set up is small and unobtrusive, but will never work well. One of the old sayings about mobile operations is really true, it says, "The efficiency of an antenna is directly proportional to it's uglyness." The bigger and uglier an antenna is, the better it is.

Richard,
RF exposure ~can~ be dangerous, but that danger is being
blown
way out of proportion. The amount of exposure depends on
frequency
and distance. There are a couple of web sites that have a
'calculator'
for distance from antennas, sorry, I don't remember them off
hand.
If your anywhere close to being 'average' as far as output
power, and antenna placement is conserned, I wouldn't worry about
it. If you
carry a 2KW amplifier around in a back-pack, with an antenna
mounted
on a 'hard-hat', well... it's probably to late for you anyway!

I think a federal government issued radio license would have precedent
over such state laws, so I seriously doubt we have that much to worry
about. But, its worth keeping an eye on this to see if any ham operator
is subjected to such a law in the coming months. This may be another
situation where the FCC has to step in to clear things up (such as they
did with PRB-1).

Stan, I certainly don't need a study to tell me what I've seen on the
highway. Not a day goes by that I don't see a person weaving all over
the road while talking on a cell phone. If accidents have gone down, as
you suggest, it is more likely because others are more aware of
cellphone users and give them a wider berth (thereby avoiding an accident).

> how could anyone take you seriously on this?

SWR is a function of the impedance match between a source and a
load.
In the case in question, the source is the amplifier, and the
load is
a dummy-load. Since the feedline (jumper) is of the same
characteristic
impedance as the load, it is in effect 'invisible' and can be
ignored.
So, an SWR meter placed between the amplifier and the dummy load
will
be measuring the impedance match between the amplifier and the
dummy-
load. If the output impedance of the amplifier, and the input
impedance
of the dummy-load are aproximately the same, the SWR meter will
read
something very close to 1.1:1. If the two impedances are not
aproximately
the same, the SWR reading will be higher than 1.1:1. The greater
the
difference in impedances, the larger the SWR reading.
Thats how it is. I don't know how to make it any simpler than
that,
without leading you by the hand through a course in basic
electronics,
which I am not going to do. If you can't accept it, that's your
problem
and you will continue to be wrong.

You got it.

Bill Nelson e-mailed me with an equally sensible
argument.

One thing I asked him that I'll know ask you now:
(Hi George--long time no argue); what tool would
you use to determine source (generator) impedance?

> by the antenna).

This is what I didn't get the first time.

The source impedance is irrelevant. The source
is just a source. In other words, all the source
does is supply *some* amount of power--it's efficiency
won't effect the SWR meter reading.

I get it now.

The next question is what should guys like me do to
actually measure the source impedance?

> : your self. (Hint: impedance follows voltage) All I can say
>
> So what? There is a difference between source impedance and
> load impedance.
>
++++ Exactly, and that difference is SWR. And SWR is a ratio of
impedance, the output impedance of the source, and the
input impedance of the load. It's found by measuring
forward voltages going from the source to the load, and the
reverse voltages going from the load to the source.

> The source impedance (and the coax input impedance that the source
> sees) determines how efficiently power is coupled into the coax. It
> does not affect how much power is reflected by the mismatch at the
> antenna coax.
>
++++ Right, and the SWR between the source and the feedline is
1.1:1
or some such low SWR. Now extend this line of thinking.
If
the impedance match between the feed line and the antenna,
or
as in the example I gave to start with, the dummy-load, is
also good (SWR = 1.1:1 or close), then your following
statement
is absolutely correct. ++++

> If it did, then you could have a perfectly matched transmitter, coax
> and antenna - which would obviously show an SWR of 1:1. By your theory,
> if the transmitter was mistuned - the SWR would change. Try it, you
> will find that this does not happen.
>
++++ No. If the source, the amplifier or transmitter, is
mis-tuned
there will be no change in SWR, and I never said there
would be.
What you are saying is that the Plate or Load controls on
an
amplifier or transmitter control output impedance, and

they do
not. They do control resonance of the tank circuit, which
means
efficient transfer of energy or power to the feed line.
+++++

> As I have suggested to others - do some reading on basic transmission
> line theory. It is not hard to understand.
>
Your absolutely correct, it isn't that hard to understand,
and I do. Might I suggest you take your own advice? You
might also review
tuned circuits, and measuring devices while your at it.

Message-ID: <396AE794.C73A7B44@oio.net>
Source record: 43665

Bill Nelson & 'Garden Hose',
I have tried your experiment, and your correct, the SWR does
not change. Of course, I never said it did. What I do not
accept is your conclusions, which are incorrect. After you do
your reviewing, take another look at my original post. If the
feedline and load impedances are the same, and do NOT CHANGE, and
if you find a high SWR at the amplifier's output, tell me what
causes it. Since there are only three variables and two of them
do not change, which one does? The three variables are feed
line,
load, and source impedances.
The 'Hose' is also correct about the waste of bandwidth.
Unfortunately, he's wrong in who understands and doesn't
understand.
So I'm going to take his advice and stop wasting bandwidth trying
to show either of you something you should already know. There
is
a misunderstanding alright, but I'm not the one who has it. I
just
feel sorry for those who think your right.

1693. Re: Linear Amps and SWR

Newsgroup: rec.radio.cb
Date: 2000-07-11 00:00:00 UTC
From: Professor <bgriffey@kwom.com>
Message-ID: <plDa5.24348$L8.79767@east3.usenetserver.com>
Source record: 43673

Well... you see tuning a system is a several step process. Putting an SWR meter from amp to antenna and getting a low reading is only part of that process. The other part involves matching the amps output impedance to the line/antenna. That is accomplished by taking the amps output and hooking a dummy load to it via a piece of 50 Ohm cable. Then I use a scope to measure the voltage across the load... and adjust amplifier components to get a maximum reading. Now you know that your amps output is as close to the 50 Ohms impedance as possible.

Remember that SWR is a "transmission line phenomenon" and has really no meaning when the line is very short... although you still have to have an impedance match to couple the power correctly. Remember also that the SWR meter has a short transmission line inside that has the usual 50 Ohm characteristic impedance associated with it.

So... to answer your question about hooking an SWR meter and load directly to the amps output...
This still will not show anything about the amps output impedance because now the SWR meter is the transmission line(instead of the coax) feeding the load. You will still not be able to evaluate the amps output impedance that way...

That's true, but the experience and preference of the officer also comes into play. I can get a good signal on someone but I don't neccessarily lock it in right away. I make sure that I know exactly which car is being clocked and that the signal is steady. Not all cops lock the radar the instant they are clocking someone.

Because that's the way every radar works. An instant on radar implies that a radar detector could not detect any signal and suddenly the radar pops on because someone is coming towards the car. It seems the term "instant on" is being used here to refer to an officer keeping the radar on "hold" until someone is in range, then taking it off "hold"... that's more of a "manual on"... like I've said, just because your radar detector is going off doesn't mean it's been locked in.

The answer to your question is yes you can. CB radio and a CB hand held both operate on the same frequency so the antennas are the same. The only problem you might have is on most CB hand helds they have what is called a BNC connector on them.You might have to go over to Radio Shake and pick up a BNC adapter. This way you can use the antenna. As far as getting better range yes you will. When it comes to CB height is everything. Try to buy a magnet antenna and place it on top of the car. Not sure if this help you out but hey I tried....

A better antenna is the next thing to do right? He would have to use a
3 element yagi or 2 element quad to get a 6db increase over his current
antenna?

This may be to far off,but, take your radio to a shop (or have a tech friend check it). It is possible that the output stages are out of alignment and when you transmit you are generating out of band frequency spikes that are greater than the band you should be in. If your output stages are not aligned correctly the transistors can go into a "thermal" mode causing this condition.

Like I said, I may be wrong, but it's just a thought.

That's one of those questions you have to answer with a "yes,
and no".
A 'better' antenna would certainly make a difference. Now all
you have
to do is decide what would be a 'beter' antenna. A 3-el yagi or
2-el quad
are better than a vertical in some instances. But there's the
other things
you need with directional antennas... tower, rotor, room to put
up the
tower, etc. The antenna is probably the cheapest part of that
senario.
Optimizing the present antenna is also an option. Can you get
it higher?
How about improving the 'ground' system? Add radials? Retune
it? Who knows.
There's a point at which 'adding' antenna gets to be out of
reason too,
but antennas are the cheapest way to improve a signal.

Just about that time of year killrwatt. Almost every afternoon like clock work, big 'ol thunder boomers between 2 and 5 pm. Last any where from 5 to 30 mins. average and 20 minutes after that all is dry and you can't even tell it rained. Even with a bunch of rain, the draught like conditions has turned the ground to a sponge like consistency that soaks up any rain in no time at all. Water table is still way below what we need and severe water restrictions are still in place. But, as you probably know, we will get it back, usually do, and with a vengeance.

FOR SALE: ICOM IC-745 HF transceiver 160-10m; includes gen coverage
(0.1-29.7 MHz) receiver. Dual VFO, 16 memory, 100 + watts out per band.
9 of 10 cosmetically, 10 of 10 operationally. Requires external
12 vdc power supply (as do most rigs nowadays). The rig has been
modified
to transmit 0.1-29.7 also.

For more info, e-mail and I'll get right back to you.

I don't need 2 rigs, so I MUST sell this to help offset cost of the new
rig I just
bought. $450 OBO (REASONABLE, pse), and I will pay shipping lower 48.

Thanks and 73,
Bob

1724. Re: 50 ohm's ?

Newsgroup: rec.radio.cb

From: JR <jr@some.net>
Message-ID: <396B3AA6.3FD4AFF9@some.net>
Source record: 43754

Ok, I just tried this on my Collins 32V-3 AM transmitter which can match a pretty wide range of impedance. With it loaded into my vertical I get 100 watts out and an swr of 1.2:1. Now by mistuning the output, the output impedance of the transmitter changes to some value other that what matches the feed line impedance and this causes a decrease in transfer of power because of the mismatch of the output of the transmitter and the feedline, but guess what? The SWR does not change. The SWR does not care what the source impedance is, it is strictly a function of the match between the feedline and the antenna. If the source impedance does not match the load impedance you will not get an efficient transfer of power, but it will not effect the SWR. Again, that is a function of the match between the feedline and the antenna feed point impedance. To quote you "Doc",
" Thats how it is. I don't know how to make it any simpler than that, without leading you by the hand through a course in basic electronics, which I am not going to do. If you can't accept it, that's your problem
and you will continue to be wrong."

I's already illegal in the UK. And so it should be, some people (not all, so dont attack me) cannot drive and talk for shit - I have seen many near accidents due to distracted drivers with cell phones. But, if you already have a law that covers it, why bother - I dont know!

1738. FS: A/S 10-meter J-pole antenna

Newsgroup: rec.radio.cb
Date: 2000-07-11 00:00:00 UTC
From: Jon <toomuchstuff@pobox.com>
Message-ID: <J3Ja5.55719$_b3.1632230@newsread1.prod.itd.earthlink.net>
Source record: 43768
Cross-posted to: alt.ham-radio.marketplace,alt.radio.cb.skip,rec.radio.amateur.equipment,rec.radio.cb,rec.radio.swap

Very nice, trim, high-gain AS high-grade aluminum J-pole. Bought new and used less than one year, then stored inside. Excellent condition. Currently has extra last radiator section added for 11-meter operation. Antenna had slightly more gain than best 11-meter omni antennas when tuned on 11 meters. Excellent where wind resistance/obtrusiveness is a concern. Asking $105.00 shipped CONUS from 91406 (Van Nuys, CA) or will negotiate if local pickup. Pls. respond via email: toomuchstuff@pobox.com THX, Jon

If you do find a 1306 and a 1307 make sure they are the NEC brand all the rest are crap. You can replace the 1306 with a 2SC2166, and the 1307 with a 2SC1969
Mitsubishi brand transistor.

> +++++

If the load and tune controls (the tank circuit)
do not vary the impedance, what does? In a basic
tube amp the output pi network is all there is
(other than a pair of relay contacts) between the
plate(s) and the coax socket. There are no plate
resistors in RF amps, and the power supply is iso-
lated by a choke. (I'm using a grounded-grid amp
with fixed bias as an example.) The tubes them-
selves are obviously not a natural match to 50 ohms,
so an impedance transformation has to take place
one way or another.

My understanding is that a tank circuit is to RF
what a transformer is to audio. They both act to
match one impedance to another in order to increase
the amount of power transfered from one stage to
another (or from the last stage to the load).

It's now my understanding that an SWR (aka reflecto)
meter won't tell you if the source impedance doesn't
match the load impedance. If you think I'm wrong
about this, lay out an experiment that I can perform
to verify your belief.

This may not be the answer you're looking for.
I've never done it, so I don't have an exact
recipe for how to do it, but I'll give you an
outline of how I think it could be done.

Many of the MFJ antenna analyzers will function
similar to a grid-dip meter. In other words,
you can loosely couple it to a tuned circuit
and measure the circuit's resonant frequency.
The analyzers go a step farther than a grid
dip meter by providing you with more information
about the circuit that you're coupled to. With
that understood, you should be able to couple
your analyzer to the tuned output circuit in
the amp and measure its resonant frequency and
get whatever other information your particular
analyzer provides. The instructions that come
with the analyzer may even give you some ideas
on how to go about coupling it to the circuit
and what information you can expect to glean
from your work.

Good luck.

This would be a good solution if the tuner could
be bypassed on receive. Using a tuner to match
the amp's input to the radio's output puts an
impedance bump in the line on receive.

You are correct, I was trying to save money. This will be my first CB and I don't want to spend a lot until I figure out what I'm doing. It'll be used mainly for camping trips (just in case) and for wheeling with the guys, so I don't need to spend too much.

Your advice is much appreciated, and I'm looking at the Unidens now. They do look a lot nicer and still aren't too costly.

Thanks for your time and help.

I can second your findings. I used different
equipment (tube amp, PW-5000 meter, dummy load)
then you did, but came to the same conclusion.
Variations in source impedance did not effect
the SWR meter reading.

The UK is the undisputed capital of the world when it comes to cell phones...More than half the population now owns one (this is due entirely to the dirt cheap cost of them). Even the teachers are pissed off with them in the classrooms. At the beginning of lectures students are asked to turn them off!

We've had a ban on driving while using a cell phone in the UK for years. The police have a crackdown every so often, and book lots of drivers. It is foolish to drive and use a cell phone, and there have been some terrible car accidents through people talking and not concentrating.

The results of my test coincide with yours.
I used a PAL 321 tube amp as the source, a
Palomar (built by Welz) PW-5000 meter, a
dummy load and a vertical as loads.

> The SWR does not care what the source impedance
> is, it is strictly a function of the match between the feedline and the
> antenna.

I believe it's a function of the match between
what's connected to the meter's output (aka
antenna) connector and the 50 ohm line section
inside the meter (which is a constant regardless
of the source impedance). In other words, the
feedline and antenna make up what I call the
composite load, and the composite load is
compared to the meter's own constant. The
match between the meter's internal constant and
the composite load is what you see on the meter.
Of course I may have just said what you said in
a wordier fashion, but it should be understood
that the SWR meter can't see the feedline/antenna
juntion when there's feedline between it and the
feedline antenna junction--especially when the
line and the load are mismatched--it sees the
feedline and the antenna as a unit.

> If the source impedance does not match the load impedance you will
> not get an efficient transfer of power, but it will not effect the SWR.

I agree. To the SWR meter the source is just
that--a source of RF--nothing more.

What will effect the SWR meter reading is the
spectral purity of the source when the load
is a tuned (read: narrow bandwidth) circuit.

Yes, I did. Between you and the other Scott, I'm convinced to look at
one of the Unidens. Thanks for your time and help. I'm sure I'll be a
lot happier with my CB purchase by avoiding the Cobra models I was
originally looking at.

[Taken to extreme:]
I'd love to see just how the "two hands on the wheel" rule would be enforcable with cars that have manual transmissions.... How does one shift gears if one can't take a hand off the wheel to do so? Or does this law implicitly forbid stick-shift cars from being driven?

Even if it passes, it sounds unenforcable.

OK, I'll state this again. I emailed ebay regarding ham radios that can be modded to VHF and UHF public service frequencies and can pose more of a threat to the public than damn CB amps and export radios. They looked at it, said it didn't fit any of their rules that didn't allow certain things so I dunno. Maybe they think that hams are the gods or radio, it really gets on my nerves.

Source record: 43791

I have the standard 49" steel whip magnetic antenna (from radio shack) with a old midland 77-145a. Without having a swr meter, is there a median "standard" length for CB use? The antenna can be adjusted +/- a few inches. Any help with this would be greatly appreciated.

Thanks in advance.

Mike

'Doc wrote:

> I have tried your experiment, and your correct, the SWR does
> not change. Of course, I never said it did.

Yes, you did. You feel that if the source
impedance (that which is connected to the
input side of the SWR meter) doesn't match
the load impedance (that which is connected
to the output side of the SWR meter), even
if the load impedance is 50 ohms, the SWR
will be something other than 1:1 based on
the differential. That's just plain wrong.
The source is just that--a source of RF--
it's impedance doesn't matter. The SWR
meter compares what's connected to its
output connector to an internal 50 ohm
line section constant. It's a one-way-
only deal where the source does nothing
but supply RF.

> What I do not
> accept is your conclusions, which are incorrect. After you do
> your reviewing, take another look at my original post. If the
> feedline and load impedances are the same, and do NOT CHANGE, and
> if you find a high SWR at the amplifier's output, tell me what
> causes it.

An impure source signal. The amp is unstable
and its spurious content is high. The narrower
the bandwidth of the load the more apparent the
effect. In other words, a dummy load will
absorb the spurious crap in the signal whereas
an antenna will reflect it back toward the SWR
meter where it is seen as reflected power that
increases the SWR meter reading.

A second, minor cause of increased SWR when an
amp is added is nonlinearity in the meter's
detector diodes.

> Since there are only three variables and two of them
> do not change, which one does? The three variables are feed
> line,
> load, and source impedances.

There's a fourth: source signal purity.

For an SWR meter to be accurate the source signal has to be pure. That's why I sometimes refer to SWR meters as "poor man's spectrum analyzers." You said it yourself; if the load impedance is constant but the SWR increases when an amp is put in the line, something has to have changed. That something is not the source impedance--it's the source purity.

I can provide an experiment that you can use to verify what I've said: Set up a broad-band solid-state amp that has easy to get to feed-back loops and alot of gain (like a 2 device Texas Star). Use an antenna with a low SWR as the load. Put an SWR meter between the amp and the antenna, and fire up the spectrum analyzer. Now, get the system up and running and measure the output SWR and spectral purity. Unsolder one end of each feedback loop and bend them up so they can't touch anything. Recheck the SWR and spectral purity. The loss of feedback has very little effect on the output (source) impedance, but it has a large effect on spectral purity (makes it worse). The decrease in spectral purity will coincide with an increase in the SWR reading while the source impedance is virtually unchanged. If you're still not convinced, lift one end of each of the 10 ohm base resistors and recheck SWR and purity. Lifting the resistors increases the bias and the stage gain. That, combined with no feedback should just about have the amp oscillating. Again, lifting the resistors doesn't have much of an effect on the output impedance, but it has a big effect on the stability and spectral purity (makes both worse). In a nutshell, the dirtier the amp gets the higher the SWR meter reading when all the other variables you mentioned are kept constant. That relationship (dirtier signal = higher SWR meter reading) is why an SWR meter can be used as a quick and dirty spectrum analyzer (as long as the load is narrow-banded).

Now, just for fun, before you reconnect the feedback loops and base resistors, change the load from the antenna to a dummy load. Since the dummy load doesn't radiate much of the power fed to it, the spectral purity will increase to a degree since the RF field the amp has to operate in is less

dense. However, the amp should still be pretty
damn dirty. But--guess what--the SWR meter reading
is much lower--it may even be flat. Why? Because
the dummy load is a broad-banded load that absorbs
the spurious crap rather than reflecting it. If
it was a change in source impedance that caused
the increase in SWR when the antenna was the load,
the SWR shouldn't have went down when you changed
to a dummy load since an antenna with a low SWR
and a dummy load should have about the same impedance.
Makes sense doesn't it?

I hope this helps. The Linears and SWR thread got
into some of this too. If you weren't following
it, you may want to read some of it. I think you'll
find it interesting. And don't go and get all de-
fensive about this. We all learn as we go along.
A week ago I would have agreed with your original
belief. I was wrong--it's that simple. I faced
that and am better off for doing so. I've been on
this newsgroup for about 4 years and have been
proven wrong (and learned from it) probably about
5 or 6 times. It sucks to be wrong, but it sure
feels good to be right about a particular issue
from that point on.

73 to all.

1770. Re: 50 ohm's ?

Newsgroup: rec.radio.cb
Date: 2000-07-11 00:00:00 UTC
From: G SEVEN <superiorwavelength@prodigy.net>
Message-ID: <8kg62k$1qjc$1@newssvr03-int.news.prodigy.com>
Source record: 43850

Ok this is what I tried with the MFJ meter. I connected the meter with a 3' jumper to the input of the amp, and a 50 ohm dummy load on the output antenna side of thwe amp. I then shunted the relay out to complete circuit. What it read when I set the frequency for 27 Mhz on the meter, is that the SWR was very high and impedance was as well. In order to lower the resistance I had to ad capacitance in the form of mica caps to the input splitter to get the ohms to come down to 50. The SWR when down a far as 1.5 I checked to see if it was reading the entire circuit by removing the dummy load and the SWR went right back up. Also when I change the capacitance on the output combiner side of the circuit I seen a change in SWR and Ohms.

So does it sound like the way I am using this meter is correct for the application? If so the idea would be to find a medium between input and output capacitance while still yielding the maximum power out @ 50 ohms to input of amp and output of antenna. Am I on the right path? Can someone critic my findings please.

Hey, if I am not mistaken and it is the same as my President Washington chassis, Only the
AM TX gets fed through the voltage regulator. SSB gets a more direct feed straight to the 13.8V
line. So if you said that it does not Transmit on both AM and SSB, most likely it is not the
Voltage regulator, or it could be a compound problem where the voltage regulator just happens
to be bad also. But that is not what is causing your problem of no SSB transmit.

Check your transmit voltages, if they are good, check your RF final transistors and drivers.
Also, since this is electronic switching for RX/TX, make sure your microphone wiring is
keyup switch is wired correctly and that the contacts are contacting for TX to ground when pressed!
It may be as simple as that.

Unit 824 NYC, is back out.

OOOPS! Correction... I forgot that my President Washington (older 858 PLL)
version is Relay
switching for RX/TX modes. So therefore check that your relay contacts are
indeed
contacting when you key up to transmit!

Unit 824 NYC, is back out.

I hear ya' Mickey! They banned them in the public schools here in the 'pile last year. (On the suncoast anyway) It will probably be banned slowly state by state as the casualties add up. I don't agree with more laws, but the sad fact is too many folks (flame shields up high) actually really do need protection from themselves because their own stupidity hurts innocent others.

==========
First off my old lady only likes guys with all ther teeth so i guess that
leaves you out.
You are correct you did state you heard the opposite as well.

You jumped
> on a portion of my post that evidently struck a nerve and it is probably
> due to the fact that your Kenwood is not living up to your expectations.
==========
What nerve you were downing a radio that I am more that tickled "pink" with
my panties .. I mean my kenwood....it is a ham radio it works very well .. I
use the kenwood on occasion to recieve 27/28 mhz as i said it has a great
reciever understand that i use only Cobra 25/29's to talk on cb or on
occasion if i want to talk cb ssb a ranger 2950 ... Listen closely the Cobra
25/29 is my cb radio ... maybe you need to pay attention as well..

> and you felt the need to defend it. If it were not true, you would have
> thrown what I said out the window because you already know the truth and
> why should anything I say ruffle your feathers? Think you are the only
> Kenwood owner on the group? You would be surprised.
> But you are the only one who took issue with it.
==========
yes i do know the truth i own one remember .. only kenwood owner? .. I don't
know i havent taken any polls lately. Maybe they are dislexic and didnt read
your post?

> Reread my posts. CAREFULLY. You will see where I stated I do not run

> have to brag, don't have to bullshit. Went this way last year with some
> other operator who said it couldn't be done. Many proved him wrong.
==========I am
a little slow show me where you said you didnt run mega power... Just what
is mega power? to me mega power is like a few thousand watts right. I ask
you again your radio is not peaked or tuned up? When do you do your
talking when no one else is on? 4 watts dont cut it in my neighborhood you
wouldnt even get 1/2 way around the block ... Well i am kinda new at this
so i guess ill have to believ that you think your talking around the world
on the cb band with 4 watts ... Which frequency maybe i can tune in to hear

your 4 watt worldwide talk show... Since you still havent mentioned the
model number of that Kraco..

>How
> do I bust the pile-ups? Simple. Location, location, and more location
> coupled with great antennas. You are not the only one who gets off on
> big antennas. If you have a great radio antenna, yes, you can hear thngs
> you wouldn't believe.
==========
Were not selling real estate Your busting pile up because of your location?
You have the baddest 4 watt station in the nation don't you... it is
conditions that will dictate who is heard especially if you say your
running 4 watts (hehe sure ok) So you have a big antenna? How many inches ..
I mean feet

> Yes, the thread was regarding bleedover, however my post was not
> related to bleed. It was stating something I was told on several
> occasions.

, which every one of my posts have stated.

Since you like to put words in my mouth you stupid ass, show me where i said
the 850 is a hotshot cb radio... Are you that fucking dense...

You are back
> pedalling something fierce as you keep reaching to say "other bands".
----------I
i am back peddiling? ... You know what you are a stupid illeterate
dickhead. At least i quote what you say.... Sorry you cannot do the same ..
Please ohh please post where I ever mention anything about "another band
"...thats right go back and look at the posts fuck face huh jackass back up
your assinine comments ... Ill be waiting ...

> Again, reread my post there, junior.

I did reread it your still a dick head..

I stated on the CB band and I hold
> to it. Get that overpriced, high-end CB at 4 watts, hell, make it 8
> watts, on the CB AM dial and I'll throw a damn barefoot Tram MOBILE on
> there that will slap you silly!
----------=========----------
----
you know what your talk is very cheap.. the only slapping that will be going
on is my nut sack . You are a 4 watt mudduck plain and simple ... i had

Trams probably before you even knew what the word cb was.

You have a great deal to learn. You may
> have some theory, but you lack comon sense!

Coming from you that means nothing to me...

I hope you guys don't believe everything you read... After speaking to BB on the phone 5 minutes ago he confirmed the amps he ran in Hot Springs. they are as follows . all amps except the 12 and 96 pill are all built around the davemade design...

2 pill= 55 built
4 pill = xforce
6pill= no class held
8 pill= 55 built
12 pill= train Built
16 pill= xforce
dc sky 96 pill = foxy built

yes hi SWR on 27.025 with no power going through it. As I go higher in
frequency the lower the SWR goes. This built by myself.
When I added three 150pf caps to the input the SWR came down as well as the
ohms.

Source record: 43869

Hmmmm, bet you act that way on the radio also. Since you jumped on a slip of the key with spelling a word, I shall stoop to your level just this once. The word is spelled d-y-s-l-e-x-i-c, and respectively, i-l-l-i-t-e-r-a-t-e, there, oh genius one. You are in one hell of a glass house.
Wasn't downing your radio, I was relating what I was told several times and the posts seem to confirm it. The radio sucks on the CB AM band. You don't like it, tough. Truth hurts sometimes!
July 10 post states I don't run mega power. I didn't think you would find it without help. I showed you where it was.
Yea, it's obvious you are new at this. Tell by the immediate resort to namecalling.
When? My radio is on every night. Make contact with you? Doubt it.
Don't care to talk with folks that spew off at the mouth like a rapid dog when unprovoked. Take issue with someone or disagree? Call 'em filthy names!
My sincerest apologies regarding the 'ol lady remark. I was wrong. Any female that would put up with someone like you isn't even in my class.
You are really digging your (rat?) hole! Once again, go back and read your own posts. You specifically said, and I quote, "...will outperform radiowise on any band". Very simple. The statement was wrong and your denial of saying it is wrong. Read:dense.
Where did I say baddest in the nation? Whos putting words in whose mouth?
Location? Top of my antenna can see Tampa Bay AND the Gulf of Mexico. Break out your map and you can pinpoint me, junior! If you don't know what that salt water can do on the direct east and west of me, you have plenty to learn. Tell me about conditions...DO TELL! (Large Grin)
There are several on this ng that have well over 100 confirmed countries, stock, barefoot, and confirmed on the CB band. I wll not debate this as you are completely ignorant on the subject. You have a long way to go.
Lastly. Your nutsack? I am assuming you are aware I am male. I must politely decline your offer of homosexuality. Not that way! But that says it all.
Your colorful choice of vernacular has led me to the decision that you are of no importance and have no valuable input that I would ever consider. There are certain individuals on the ng whose opinions are respected and that was earned over time. No matter how much you know or think you know, your posts will always be suspect because of your inability to converse and your personal attacks against someone instead of the issue. Bad thing about a reputation, is you can't take it back.You started out with a bang. And shot yourself right in the mouth....

They are in Naperville. If you don't mind a drive take I-57 to the 335 exit Monee go to Real World Electronics in the Petro station. Probably the best techs in the midwest.

Unless the input impedance is way off, there's
no need for the tuner.

> Amps usually screw up this match anyway, this
> could make it better, or worse.

I don't agree. If the amp compromises
the SWR between the radio and antenna
that much when in the receive mode,
something is wrong with it or it has a
design flaw (like too large a sampling
cap in the keying circuit).

> Enough people have used tuners on their amps to
> show this is not a problem.

I agree that peole do it--but that doesn't make
it the right way to go. If the input SWR is high,
the input circuit needs to be repaired or modified.
Using a tuner is a flawed, Band-Aid type of measure.

Aluminum is an RF shield; lead hats are for x- and gamma-rays and ionising particle radiation! Seriously, distance from the radiator is your best protection. Follow the suggestion above to visit the ARRL and FCC web sites for the formulas.

Trust me, Aaron, this guy was so oblivious, he never even saw me screaming at him (the windows were closed). About the only thing he heard was the horn (and I'm not even completely certain of that).

But, I agree. Things are different today. Today, these clowns drive like this, put our lives at risk, and then think they are the victim when someone gets mad at them.

Kim W5TIT wrote:
>
> The solution to that is to have the police stop that person enough to where
> their Driver's license is at risk...not just take the cellular phone away.
> They'd weave under any other kind of distraction!

Kim, I think most cops would have a problem justifying such a stop.
As long as they were not breaking the law (weaving into other lanes,
etc.), they would have a hard time justifying the stop because of
"slight" weaving.

Of course, the cop could follow the person until the person actually
does weave into another lane, or breaks some other law, but few would be
willing to put that much time into such an effort (they have other
things to deal with).

The other option is to stop the driver for suspected DUI, but even
that gets a little difficult if the driver stays in their lane (no
excessive weaving).

Actually, the solution might be to redesign cell phones for mobile
use. Make them more like a conventional radio, with a handheld
microphone and speaker on the dash. People using a conventional radio
don't seem to tune out as much - they stay more aware of what is going
on around them.

Another option is to improve the sound quality of the cell phone. I
usually have to listen hard to understand what is being said on my cell
phone, unlike my radio where I can simply turn the volume up. It is
that concentration used when trying to understand what is being said
that distracts from the other things around the cell phone user. Make
cell phones easier to hear, and understand, and I think the distraction
would decrease somewhat.

Hello Ken: This is bogas. Ask the gentelman for field strength
measurement comparison test data.

I would add a 4 each 102 inch Francis Amazer ground radials to the A99,
and coil up the coax at the A99 antenna connector, about a 9 inch
diameter with about ten turns.

And keep the salt fer makin Ice Cream

I have an Eagle Spitfire 454 10/11 Meter handheld radio that i am looking to sell.

The radio rates 10 out of 10 on both asthetic and electronic condition.

The unit is all mode, AM, FM, USB & LSB with 9 bands of 45 channels, and 1 band of 49 for a total of 454 channels covering 25.165 mhz thru 29.655 mhz. PEP power is 4 to 5 watts on AM & FM, swings between 6 to 7 watts on SSB. The radio is completely stock except for export channel conversion.

The price is $135, and all accessories & paperwork are included with radio in original box.

Method of payment is Postal Money Order, and buyer pays shipping fee of $5

How about a few more solutions while we're at it...

Redesign cigarettes so that they go out if they fall between your legs. Billboards that reverse as you go by so you can't look at them. Car radios with no knobs and no readout to take away your attention. Speedometers and gauges that can be seen without taking your eyes off the road. Duct tape for your passengers mouths. Soundproof back seat with handcuffs installed for children. Yea, there are lots of ways to redesign things to make driving safer...

Gonna try again.
Anyone around the central Connecticut region looking to trade or buy a
Hunter Bandit 2000a tube amp ? I dont fiddle with tube amps and want to get
rid of it before it gets lost in a pile of dust.

1813. How do you register?

i have seen 55 and bb at many breaks working as a team maybe you are jealous
i have also seen your antennas they have plumbers fittings unlike the 55 who
uses qualtiy parts
you need to get out of the heat its warping your brain ..

1818. Re: 50 ohm's ?

Newsgroup: rec.radio.cb
Date: 2000-07-12 00:00:00 UTC
From: JR <jr@some.net>
Message-ID: <396BC7FD.8A072A50@some.net>
Source record: 43707

Bill,

It is the same principle as using an antenna turner to work into a high swr system. The antenna tuner can effect an efficient transfer of energy, but it does not change the high swr on the feedline/antenna system. Beyond the grasp of some on here.

Bill Eitner wrote:

> JR wrote:

Well, I never used the 5 foot whip...I used the magmount with a 36 inch center loaded SLA with fairly good results. I figured the SLA wouldn't be worth selling what with the shipping cost equal to its value...but if anyone wants it let me know...I'd sell it for about $7.

Thanks for the insight-
When I keydown, the white RX lights behind the meters turn red, which is the TX 'on the air' light.
Should I take from this that the relay is working fine? It does click, the TX lights red, but there's no movement on the needle(s)...
Voltages check out okay up until the finals, so I have ordered replacements for them. Everything else seems to be in really clean shape, though, so I'm glad for that. Don't know yet if I'll keep this one as clean as it is, no mods at all. Kind of a throwback, so I might keep it that way! :-)

1831. Re: RADAR JAMMER

Newsgroup: rec.radio.cb
Date: 2000-07-12 00:00:00 UTC
From: Bill Nelson <billn@spock.peak.org>
Message-ID: <8kgsnntq7@bashir.peak.org>
Source record: 43720

Hamm4fun <hamm4fun@aol.com> wrote:
: I always thought the idea of a RADAR DETECTOR was to detect the radar before it
: detected you. If it is giving you this kind of heads up notice as it should
: there is no reason someone could not jam the radar without being detected. Now
: as to whether the harmonics from a dirty CB amp can do this, that is another
: story. You would have to have a harmonic that fell on the operating freq of the
: radar and it would have to be stong enough to capture the receiver.

It is kind of a tossup. The receiver on the radio gun can be tuned for
a single frequency - so it will detect a weaker signal than a radar detector,
which has to be tuned to receive a broad band of frequencies.

Simple reduction in natural/manmade rf noise guarantees that.

I don't recall radar units using FM or PM, so "capture" would not apply.

All that the harmonic would have to be is strong enough to mask the reflected
radar signal.

.....

Someone else wrote:

:>Because that's the way every radar works. An instant on radar implies that a
:>radar detector could not detect any signal and suddenly the radar pops on
:>because someone is coming towards the car. It seems the term "instant on" is
:>being used here to refer to an officer keeping the radar on "hold" until
:>someone is in range, then taking it off "hold"... that's more of a "manual
:>on"... like I've said, just because your radar detector is going off doesn't
:>mean it's been locked in.

I don't see that how the radar transmitter is turned on has anything to do
with whether it is "instant on" or not.

You need ground radials of at least 1/4 wavelength for them to be
effective. 3 feet each is a bit short.

279150 MHz. Hm, that would require an antenna somewhere around 1/10 inch
long (as a rough guess). I assume you meant 27.9150 MHz?

Yes, I can see needing a tuning capacitor, if you are using a vertical
radiator that is over one electrical wavelength long.

OK... but I don't quite understand why the match would be so far off when
you are just going through a relay into a dummy load. That isn't right...

When my amps are not active... I too am going through a relay and the match
is absolutely flat into a dummy load. That is normal.

If a tuner causes you to lose that much then there is problem but a lot of times on solidstate amps it is just a bad match. You cant design an amp with a 27MHZ (3 to 30)wide bandwidth and expect it to be a good match at all freqs. If the tuner helps it helps if it don't it dont. Never said it was a fix for all problems and definitely not a band aid cure. Howerever there are a lot of amps that can benifit from a tuned front end as well as a tuned output.

Yes they do Capture. They use a PLL circuit to detect the difference in freq
between the signal that is sent and the rx signal. They will lock onto which
ever signal is stongest, the actual reflected signal or a jamming signal. You
get a Doppler shift of 33hz per MPH. It doesn't take a whole lot of power to
screw one up. they only transmit a few milliwatts and get microwatts back.

>I always thought the idea of a RADAR DETECTOR was to detect the radar before
>it detected you.

It might, but what the radar detector is detecting is the signal coming from the radar. You might get lucky and pick up a stray signal that is bouncing and not returning to the radar...

>Now as to whether the harmonics from a dirty CB amp can do this, that is another
>story. You would have to have a harmonic that fell on the operating freq of
>the
>radar and it would have to be stong enough to capture the receiver.

Well, I've interfered with the radar unit in my car with a 2w 2m HT and a standard cellphone.. I'm not sure if they're harmonics of the 24ghz signal from the radar or not, but they effectively send RFI into the radar making it unable to clock vehicles.

Last night I was having fun with someone... got behind them and saw they had a radar detector (I could see the red light on..) so I turned the radar off and watched the red light turn off. I then turned it on again and watched the red light come back on. I then kept hitting the hold button watching the red light turn on and off... must have really annoyed him. :)

When I was a kid, loved to build Allied and Heathkit radio kits talking to a Scanner Antenna. Would like to re-enter the world of CB and antennas and would appreciate some advice on what is the best set-up available today? Technology has changed in the 25 years since I was a kid.

Thanks ...

My PRO-34 will trigger a radar detector if the scanner is set to
900 MHz and held in front of the detector. Haven't tried it with
my PRO-90, I haven't used a detector in three years...

Hi! This time I am trying to fix a friend's SWR instead of mine. He has a 10ft. painted pole sunk about 3 feet into the groud. He is using a 102' antenna and mirror mount that clasps to the pole. He has something like 10 feet of ground wire wrapped around the mount which is also wrapped around a pole in the ground. The SWR he is getting is around 5. Any ideas how to lower his SWR?

Anonymous,
for all practical purposes, your friend doesn't have a
ground.
Or, I guess I should have said a ground plane. Making one for
him
woudl sure help the SWR situation.

Hank,
There are three ways for that tower section to fit into the
one under it(three legs). Did you try rotating the section a
'leg' at a time to make it fit?
As a last resort, try jumping up and down on it...

> ken
> 488 central texas

Ken,
It's part myth and part true. It will improve conductivity
at the ground rod, but that isn't going to help the antenna
much since it doesn't use the ground rod as an RF ground. There
is a 'down' side to this 'improvement' too. The salt will
cause the ground rod to corrode much faster than 'normal',
meaning you'll get to replace it more often. Once you put the
salt down, you can't get rid of it, so be really sure before
you do.

Cross-posted to: rec.radio.cb,rec.radio.swap

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.
Great deal ! ! !!
A Picture can be e-mailed.

Mike,
Without having an SWR meter to check what your doing, don't
cut
the antenna at all. The best that you could do is ruin the
antenna.
Even with An SWR meter, the amount you may need to change the
length
of the 'whip' would be small, don't try cutting "inches" off,
more
like small fractions of an inch.
Best advice is borrow/buy a meter.

Urine is high in Phosphorous, the alkalinity level can be perfectly neutral, with a ph usually of 6.0(quite stable) Won't have much effect (maybe in many, many, gallons) on your antenna, but it sure will help grow some stuff.
There are many different type acid/salts and the common (but not all) characteristics when combined with an aqueous (H20 converged) effect produce change in their reaction with substances they may come into contact with. Hence, the rock salt.

Washington is a good radio. Copper is not the place to buy one. A metal antenna is your best bet. Buy a Maco ground plane. There are plenty of choices other than the mega mart clearing houses for a radio, find one and use it, you will be happier.

KRS,
You can't use the MFJ analizer directly to check the output impedance of a radio/amplifier. You can use it to check what you 'can' use to check for impedance at the radio/amplifier output, to make sure it's what it is supposed to be. My original suggestion on how to check for output impedance, using a dummy-load works just fine. It won't tell you what the impedance -is-, but it can tell you what it -isn't-.

I'd take a close look at the amplifier to see how the
'by-pass'
is done. Sounds like something wrong with the relay or by-pass
line.

Anonymouse you should just break down and buy a cheap base antenna,
Sorry, I mean tell your bud to buy a cheapie antenna! If you don't have
funding available make a dipole, information can be found in your local
library under Ham/Amateur radio..... And if you must play around with the
whip, the books from the library will give you enough information to make it
work.....

>

Tell me exactly how an SWR meter can measure a mis-match at
a remote point, unless the feed line is a whole number multiple
of an electrical 1/2 wave length. If the feed line IS a
multiple
of an electrical 1/2 wave length, then yes, it is in effect
transparent, it presents the input impedance of the load end
at the feed line's input end. That's the only case where this
will
be true.
An SWR meter is not frequency dependent. It is also not
impedance
dependent. It will work at 1.5 Mhz and at 30 Mhz. It will
work
in a 50 ohms 'system', and it will work in a 450 ohm 'system'.
An
SWR meter works by comparing forward and reflected voltages,
which
are a product of the impedances at the input and output of the
meter.
An SWR meter can not read SWR at any point in an antenna
system,
other than the point at which it is inserted, except in the
instance
I cited above. If you have an SWR meter that can measure at a

point remote from it's self, you better hang on to it, 'cuz
it's
a miracle! Start watching for that star in the East, and those
three guys on camels!

I would agree on the Radio, However since you have given some indication that your knowledge is somewhat limited, I would suggest the Antron 99 or the Imax 2000, both are reasonable performers, the 99 is less expensive, the Imax will give you the performance edge, Yeah the Maco might perform slightly better, But The Assembly and tuning ease of the Antron 99, or Imax 2000 gives it my vote!! I've sold quite a few Maco V5/8's, And 8 out of 10 times I will end up helping tune the things.... Not everyone has access to persons familiar with the antenna, or willing to tune it for free... With the Imax or Antron you simply screw 3 pieces together, tighten it up, mount it on a pole, check SWR and put it in the air! Usually no tuning, and if tuning is needed it is very simple....

Aren't you suppose to check the alignment on the ground first before
assembling the tower in the air?

>they are not bent i
>checked em on the ground!Does anybody have any secrets on how to get this shit
>together "we already used wd40"

WD-40? WD- 40 will not solve an alignment problem. By your own
admission of using WD-40 you are saying that you have a connection
fit problem. Measure with a mic the male and female portion of the
legs.

If you have an in the air alignment problem then the only thing I
could suggest is to take a board and lay it on the top of the existing
tower legs Then smack the board and make some wittiness marks on it.
Remove the board and then use it as a guide to align the on ground
tower section.

I agree with Doc, Keep the 99, As for a Beam, A PDL 2 is a great little antenna, but for half the price about 100 bux, and about the same size look into the Maco V-Quad, its much simpler to assemble than the PDL 2, Less bulky, comparable performance, and less $$$

The lightning may have burned the power limiting chip up inside the power supply. Take a volt meter and measure the voltage at the terminals. If it is 24V then It burned up the limiter. The fuse would not have anything to do with this...

> to verify your belief.
> --

First, let me ask you a question. If the SWR meter is NOT
making a comparison between the impedance at it's input, and
the impedance at it's output, WHAT is it measureing? (I
know
the meter measures forward/reflected voltages, but how are
these voltages produced?)
'Doc

PS - I can think of a simple experiment to show that an SWR
meter is not 50 ohms impedance dependent, but it
requires
two 2:1 'unun' baluns. I don't have any of those and I
really don't think many people do. Do you happen to
have
two of them, or are you willing to make them? I can't
think
of an easy way of changing the impedance of the radio,
without
taking a chance of harming the radio. That's why I'd
use
the two unbalanced to unbalanced 'baluns'.

You say antenna is 42ft long!!. This is way too long.This type of antenna radiates off of the end. Generally this is a very poor antenna but sometimes useful for working short skip. This will somtimes let you work stations no one else can hear. You are working station at 500km when everyone else is working station at 5000km. Only you can hear the close stations. I have used antenna like this from South Ga. It let me talk into Louisanna when everyone else was talking to California. This can be a lot of fun but I would not want this to be my only antenna, sometimes Hamm4fun like to work California too.

Sounds like you are grabbing at some hypothetical straws.
Unless the impedance of the amp is way off from 50 there should not be enough
of a problem to bother the rx. Amps usually screw up this match anyway, this
could make it better, or worse. Enough people have used tuners on their amps to
show this is not a problem.

I always thought the idea of a RADAR DETECTOR was to detect the radar before it detected you. If it is giving you this kind of heads up notice as it should there is no reason someone could not jam the radar without being detected. Now as to whether the harmonics from a dirty CB amp can do this, that is another story. You would have to have a harmonic that fell on the operating freq of the radar and it would have to be stong enough to capture the receiver.

There is no real problem in paralelling power supplies. It is done all the time. The problem here is that the power supplies he wants to use. They drift to much to keep the loads equalized. You can conpensate for this to some degree by using current equalizing resistors in series with each power supply. Resistors large enough to compensate for the poor regulation of the Pyramid powersupplies would probably seriously effect the efficency of the whole setup. Maybe you would get less than 30 amps out.

Source record: 43902

Bill,
!! Now I know why you think as you do!! Unfortunately, your mistaken. An SWR meter does use a section of coax in picking up the voltages in the feed line, but! That small length of coax is no longer of what ever impedance it was supposed to be to start with. It's too short to exhibit a characteristic impedance, and is only used because it's a convenient way of mechanically making the 'pick-up'. There are any number of SWR meters that do NOT use a section of coax in their circuit. Two that I have direct knowledge of are the Radio Shack meter, and the WM-1 made by Autek Research. Never having had the back off of a Bird, I have no idea what they use.
A voltage 'pick-up' is usually a wire run parallel to a piece of center conductor and dialectric insulation from a section of coax. There's a second wire run parallel to the same section of center conductor/dialectric for reverse voltage pick up. It's usually done this way because it's easy to do, run the parallel wires and then tape them to the dialectric insulation. You can do
the exact same thing by using 'stiff' wire that will hold it's shape, and not use part of a section of coax. You'd have to recalibrate the circuit because voltage varies with distance. The distance between the pick-up wires and the wire carrying the signal would change, probably.
But an SWR meter does NOT have a piece of coax inside it to use for comparison to the output. It compares the input of the meter to the output of the meter.

You are correct in a way there Blutarsky, but you sure have a way in arriving at your conclusions. Nonetheless, what you stated is true in a raw sort of way. Hell, skip the salt and piss altogether and just water your ground area enough. Salt (more effectively than urine) can be used to raise the levels in soils that are lacking.

Yea, the sticks will be easier to handle. Ease of use is why I always keep one in the truck or van. Climb a tree, bungee strap that sucker in, and camping takes on a whole new realm.

Those factors are *extremely* relevant. If you can show that you were paying attention to the road, both hands on the wheel, and doing all that is reasonable to drive in a safe, courteous manner, then your liability is reduced, or none. Talking on the phone, eating, applying make-up, and certainly drunk, when you well know that those activities can potentially be hazardous, increase your liability. If road conditions reduce your visibility, ability to stop, chang elanes, or whatever, and you go ahead anyway and do these things, you are clearly being less responsible, and should be held accountable as such.

As a follow up, a judge has ruled that the town in Pa that originally
wrote the law that Marlboro fashioned theirs after is (1) not enforceable
and (2) already covered by PA DMV laws concerning reckless driving. Both
NY and NJ have similar laws as well so it is conceivable that the Marlton
will also be voted down. According to broadcast radio, there isn't
enough support amongst Marlboro's feuding lawmakers anyway.

Again, much ado over nothing.

RK-56 PTT switches are crap. Just put a new one in mine, good as gold now.
.... for a while anyway.
